1.1.10  **_ex
    RMI connector function for the class ..... 10

```

1.1.1

```
struct bHYPRE_IJMatrixView__object
```

Symbol "bHYPRE_IJMatrixView" (version 1.0.0)

This interface represents a linear-algebraic conceptual view of a linear system. The 'I' and 'J' in the name are meant to be mnemonic for the traditional matrix notation A(I,J).

1.1.2

```
extern C bHYPRE_IJMatrixView
bHYPRE_IJMatrixView__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

1.1.3

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJMatrixView_SetLocalRange ( bHYPRE_IJMatrixView self,
int32_t ilower, int32_t iupper, int32_t jlower, int32_t jupper, sidl_BaseInterface
*_ex)
```

Set the local range for a matrix object. Each process owns some unique consecutive range of rows, indicated by the global row indices **ilower** and **iupper**. The row data is required to be such that the value of **ilower** on any process p be exactly one more than the value of **iupper** on process $p - 1$. Note that the first row of the global matrix may start with any integer value. In particular, one may use zero- or one-based indexing.

For square matrices, **jlower** and **jupper** typically should match **ilower** and **iupper**, respectively. For rectangular matrices, **jlower** and **jupper** should define a partitioning of the columns. This partitioning must be used for any vector v that will be used in matrix-vector products with the rectangular matrix. The matrix data structure may use **jlower** and **jupper** to store the diagonal blocks (rectangular in general) of the matrix separately from the rest of the matrix.

Collective.

1.1.4

```
int32_t
bHYPRE_IJMatrixView_SetValues ( bHYPRE_IJMatrixView self, int32_t
nrows, int32_t* ncols, int32_t* rows, int32_t* cols, double* values, int32_t
nnonzeros, sidl_BaseInterface *_ex)
```

Sets values for **nrows** of the matrix. The arrays **ncols** and **rows** are of dimension **nrows** and contain the number of columns in each row and the row indices, respectively. The array **cols** contains the column indices for each of the **rows**, and is ordered by rows. The data in the **values** array corresponds directly to the column entries in **cols**. The last argument is the size of the cols and values arrays, i.e. the total number of nonzeros being provided, i.e. the sum of all values in ncols. This function erases any previous values at the specified locations and replaces them with new ones, or, if there was no value there before, inserts a new one.

Not collective.

1.1.5

```
int32_t
bHYPRE_IJMatrixView_AddToValues ( bHYPRE_IJMatrixView self, int32_t
nrows, int32_t* ncols, int32_t* rows, int32_t* cols, double* values, int32_t
nnonzeros, sidl_BaseInterface *_ex)
```

Adds to values for **nrows** of the matrix. Usage details are analogous to **SetValues**. Adds to any previous values at the specified locations, or, if there was no value there before, inserts a new one.

Not collective.

1.1.6

```
int32_t
bHYPRE_IJMatrixView_GetValues ( bHYPRE_IJMatrixView self, int32_t
nrows, int32_t* ncols, int32_t* rows, int32_t* cols, double* values, int32_t
nnonzeros, sidl_BaseInterface *_ex)
```

Gets values for **nrows** rows or partial rows of the matrix. Usage details are analogous to **SetValues**.

1.1.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJMatrixView_SetRowSizes ( bHYPRE_IJMatrixView self, int32_t*
sizes, int32_t nrows, sidl_BaseInterface *_ex)
```

(Optional) Set the max number of nonzeros to expect in each row. The array **sizes** contains estimated sizes for each row on this process. The integer **nrows** is the number of rows in the local matrix. This call can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

1.1.8

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJMatrixView_Print ( bHYPRE_IJMatrixView self, const char*
filename, sidl_BaseInterface *_ex)
```

Print the matrix to file. This is mainly for debugging purposes.

1.1.9

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJMatrixView_Read ( bHYPRE_IJMatrixView self, const char*
filename, bHYPRE_MPICommunicator comm, sidl_BaseInterface *_ex)
```

Read the matrix from file. This is mainly for debugging purposes.

1.1.10

```
struct bHYPRE_IJMatrixView__object* bHYPRE_IJMatrixView__connectI const
char * url sidl_bool ar struct sidl_BaseInterface__object
**_ex
```

RMI connector function for the class. (no addref)

SIDL_C_INLINE_DECL int32_t
```

```
bHYPRE_StructMatrixView_SetGrid ( bHYPRE_StructMatrixView self,
bHYPRE_StructGrid grid, sidl_BaseInterface *_ex)
```

Set the grid on which vectors are defined. This and the stencil determine the matrix structure.

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrixView_SetStencil ( bHYPRE_StructMatrixView self,

int32_t* index, int32_t dim, int32_t num_stencil_indices, int32_t* stencil_indices,
double* values, sidl_BaseInterface *_ex)
```

Set matrix values at grid point, given by "index". You can supply values for one or more positions in the stencil. "index" is an array of size "dim"; and "stencil_indices" and "values" are arrays of size "num_stencil_indices".

1.3.6

```
int32_t
bHYPRE_StructMatrixView_SetBoxValues ( bHYPRE_StructMatrixView

int32_t* stencil_indices, double* values, int32_t nvalues, sidl_BaseInterface *_ex)
```

Set matrix values throughout a box in the grid, specified by its lower and upper corners. You can supply these values for one or more positions in the stencil. Thus the total number of matrix values you supply, "nvalues", is num_stencil_indices x box_size, where box_size is the number of grid points in the box. The values array should be organized so all values for a given box point are together (i.e., the stencil index is the most rapidly varying). "ilower" and "iupper" are arrays of size "dim", "stencil_indices" is an array of size "num_stencil_indices", and "values" is an array of size "nvalues".

```

Set matrix coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

self, int32_t part, int32_t var, int32_t to_var, int32_t symmetric,
sidl_BaseInterface *_ex)
```

Define symmetry properties for the stencil entries in the matrix. The boolean argument **symmetric** is applied to stencil entries on part **part** that couple variable **var** to variable **to_var**. A value of -1 may be used for **part**, **var**, or **to_var** to specify “all”. For example, if **part** and **to_var** are set to -1, then the boolean is applied to stencil entries on all parts that couple variable **var** to all other variables.

By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

```

Set vector coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then **value** consists of a pair of doubles representing the real and imaginary parts of the complex value.

1.6.4

```

double* values, int32_t nvalues, sidl_BaseInterface *_ex)
```

Set vector coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

2.1

```
struct bHYPRE_Operator__object
```

Symbol "bHYPRE.Operator" (version 1.0.0)

An Operator is anything that maps one Vector to another. The terms **Setup** and **Apply** are reserved for Operators. The implementation is allowed to assume that supplied parameter arrays will not be destroyed.

2.2

```
extern C bHYPRE_Operator
bHYPRE_Operator__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

2.3

```
SIDL_C_INLINE_DECL int32_t

bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)

Set the MPI Communicator. DEPRECATED, use Create:

2.4

```
SIDL_C_INLINE_DECL void
bHYPRE_Operator_Destroy ( bHYPRE_Operator self, sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

self, int32_t* diag_sizes, int32_t* offdiag_sizes, int32_t local_nrows,
sidl_BaseInterface *_ex)
```

(Optional) Set the max number of nonzeros to expect in each row of the diagonal and off-diagonal blocks. The diagonal block is the submatrix whose column numbers correspond to rows owned by this process, and the off-diagonal block is everything else. The arrays **diag_sizes** and **offdiag_sizes** contain estimated sizes for each row of the diagonal and off-diagonal blocks, respectively. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

4.1.4

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJParCSRMatrix_SetLocalRange ( bHYPRE_IJParCSRMatrix
self, int32_t ilower, int32_t iupper, int32_t jlower, int32_t jupper,
sidl_BaseInterface *_ex)
```

Set the local range for a matrix object. Each process owns some unique consecutive range of rows, indicated by the global row indices **ilower** and **iupper**. The row data is required to be such that the value of **ilower** on any process p be exactly one more than the value of **iupper** on process $p - 1$. Note that the first row of the global matrix may start with any integer value. In particular, one may use zero- or one-based indexing.

For square matrices, **jlower** and **jupper** typically should match **ilower** and **iupper**, respectively. For rectangular matrices, **jlower** and **jupper** should define a partitioning of the columns. This partitioning must be used for any vector v that will be used in matrix-vector products with the rectangular matrix. The matrix data structure may use **jlower** and **jupper** to store the diagonal blocks (rectangular in general) of the matrix separately from the rest of the matrix.

Collective.

4.1.5

```
int32_t
bHYPRE_IJParCSRMatrix_SetValues ( bHYPRE_IJParCSRMatrix self,
int32_t nrows, int32_t* ncols, int32_t* rows, int32_t* cols, double* values, int32_t
nnonzeros, sidl_BaseInterface *_ex)
```

Sets values for **nrows** of the matrix. The arrays **ncols** and **rows** are of dimension **nrows** and contain the number of columns in each row and the row indices, respectively. The array **cols** contains the column indices for each of the **rows**, and is ordered by rows. The data in the **values** array corresponds directly to the column entries in **cols**. The last argument is the size of the cols and values arrays, i.e. the total number of nonzeros being provided, i.e. the sum of all values in **ncols**. This function erases any previous values at the specified locations and replaces them with new ones, or, if there was no value there before, inserts a new one.

Not collective.

4.1.6

```
int32_t
bHYPRE_IJParCSRMatrix_AddToValues ( bHYPRE_IJParCSRMatrix self,
int32_t nrows, int32_t* ncols, int32_t* rows, int32_t* cols, double* values, int32_t
nnonzeros, sidl_BaseInterface *_ex)
```

Adds to values for **nrows** of the matrix. Usage details are analogous to **SetValues**. Adds to any previous values at the specified locations, or, if there was no value there before, inserts a new one.

Not collective.

4.1.7

```
int32_t

```

Gets values for **nrows** rows or partial rows of the matrix. Usage details are analogous to **SetValues**.

bHYPRE_IJParCSRMatrix_SetRowSizes ( bHYPRE_IJParCSRMatrix self,

```

(Optional) Set the max number of nonzeros to expect in each row. The array **sizes** contains estimated sizes for each row on this process. The integer **nrows** is the number of rows in the local matrix. This call can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

4.1.12

```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

4.1.13

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_IJParCSRMatrix_Assemble ( bHYPRE_IJParCSRMatrix self,
sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with Initialize preceding Assemble. Values can only be set in between a call to Initialize and Assemble.

4.1.14

int32_t row, int32_t* size, struct sidl_int_array** colind, struct
sidl_double_array** values, sidl_BaseInterface *_ex)
```

The GetRow method will allocate space for its two output arrays on the first call. The space will be reused on subsequent calls. Thus the user must not delete them, yet must not depend on the data from GetRow to persist beyond the next GetRow call.

4.3.13 ****_ex** *RMI connector function for the class* 68

4.3.1

```
struct bHYPRE_StructMatrix__object
```

Symbol "bHYPRE.StructMatrix" (version 1.0.0)

A single class that implements both a view interface and an operator interface. A StructMatrix is a matrix on a structured grid. One function unique to a StructMatrix is SetConstantEntries. This declares that matrix entries corresponding to certain stencil points (supplied as stencil element indices) will be constant throughout the grid.

4.3.2

```
bHYPRE_StructMatrix
bHYPRE_StructMatrix__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

4.3.3

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_SetGrid ( bHYPRE_StructMatrix self,
bHYPRE_StructGrid grid, sidl_BaseInterface *_ex)
```

Set the grid on which vectors are defined. This and the stencil determine the matrix structure.

4.3.4

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_SetStencil ( bHYPRE_StructMatrix self,
bHYPRE_StructStencil stencil, sidl_BaseInterface *_ex)
```

Set the stencil. This and the grid determine the matrix structure.

4.3.5

```
int32_t
bHYPRE_StructMatrix_SetValues ( bHYPRE_StructMatrix self, int32_t*
index, int32_t dim, int32_t num_stencil_indices, int32_t* stencil_indices, double*
values, sidl_BaseInterface *_ex)
```

Set matrix values at grid point, given by "index". You can supply values for one or more positions in the stencil. "index" is an array of size "dim"; and "stencil_indices" and "values" are arrays of size "num_stencil_indices".

4.3.6

```
int32_t
bHYPRE_StructMatrix_SetBoxValues ( bHYPRE_StructMatrix self, int32_t*
ilower, int32_t* iupper, int32_t dim, int32_t num_stencil_indices, int32_t*
stencil_indices, double* values, int32_t nvalues, sidl_BaseInterface *_ex)
```

Set matrix values throughout a box in the grid, specified by its lower and upper corners. You can supply these values for one or more positions in the stencil. Thus the total number of matrix values you supply, "nvalues", is num_stencil_indices x box_size, where box_size is the number of grid points in the box. The values array should be organized so all values for a given box point are together (i.e., the stencil index is the most rapidly varying). "ilower" and "iupper" are arrays of size "dim", "stencil_indices" is an array of size "num_stencil_indices", and "values" is an array of size "nvalues".

4.3.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_SetNumGhost ( bHYPRE_StructMatrix self,
int32_t* num_ghost, int32_t dim2, sidl_BaseInterface *_ex)
```

Set the number of ghost zones, separately on the lower and upper sides for each dimension. "num_ghost" is an array of size "dim2", twice the number of dimensions

4.3.8

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_SetConstantEntries ( bHYPRE_StructMatrix self,
int32_t num_stencil_constant_points, int32_t* stencil_constant_points,
sidl_BaseInterface *_ex)
```

State which stencil entries are constant over the grid. Supported options are: (i) none (the default), (ii) all (stencil_constant_points should include all stencil points) (iii) all entries but the diagonal.

4.3.9

```
int32_t
bHYPRE_StructMatrix_SetConstantValues ( bHYPRE_StructMatrix self,
int32_t num_stencil_indices, int32_t* stencil_indices, double* values,
sidl_BaseInterface *_ex)
```

Provide values for matrix coefficients which are constant throughout the grid, one value for each stencil point. "stencil_indices" and "values" is each an array of length "num_stencil_indices"

4.3.10

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_SetCommunicator ( bHYPRE_StructMatrix self,
bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)
```

Set the MPI Communicator. DEPRECATED, Use Create()

4.3.11

```
SIDL_C_INLINE_DECL void
bHYPRE_StructMatrix_Destroy ( bHYPRE_StructMatrix self,
sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

4.3.12

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructMatrix_Assemble ( bHYPRE_StructMatrix self,
sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with Initialize preceding Assemble. Values can only be set in between a call to Initialize and Assemble.

4.5.1

```
struct bHYPRE_SStructMatrix__object
```

Symbol "bHYPRE.SStructMatrix" (version 1.0.0)

The semi-structured grid matrix class.

Objects of this type can be cast to SStructMatrixView or Operator objects using the __cast methods.

4.5.2

```
bHYPRE_SStructMatrix
bHYPRE_SStructMatrix_connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

4.5.3

```
SIDL_C_INLINE_DECL int32_t

bHYPRE_SStructGraph graph, sidl_BaseInterface *_ex)
```

Set the matrix graph. DEPRECATED Use Create

4.5.4

part, int32_t* index, int32_t dim, int32_t var, int32_t nentries, int32_t* entries,
double* values, sidl_BaseInterface *_ex)
```

Set matrix coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

4.5.5

```
int32_t
bHYPRE_SStructMatrix_SetBoxValues ( bHYPRE_SStructMatrix self,
int32_t part, int32_t* ilower, int32_t* iupper, int32_t dim, int32_t var, int32_t
nentries, int32_t* entries, double* values, int32_t nvalues, sidl_BaseInterface *_ex)
```

Set matrix coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

4.5.6

```
int32_t
bHYPRE_SStructMatrix_AddToValues ( bHYPRE_SStructMatrix self,
int32_t part, int32_t* index, int32_t dim, int32_t var, int32_t nentries, int32_t*
entries, double* values, sidl_BaseInterface *_ex)
```

Add to matrix coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type.

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

4.5.7

```
int32_t
bHYPRE_SStructMatrix_AddToBoxValues ( bHYPRE_SStructMatrix self,
int32_t part, int32_t* ilower, int32_t* iupper, int32_t dim, int32_t var, int32_t
nentries, int32_t* entries, double* values, int32_t nvalues, sidl_BaseInterface *_ex)
```

Add to matrix coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of stencil type. Also, they must all represent couplings to the same variable type.

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

4.5.8

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructMatrix_SetSymmetric ( bHYPRE_SStructMatrix self,
int32_t part, int32_t var, int32_t to_var, int32_t symmetric, sidl_BaseInterface
*_ex)
```

Define symmetry properties for the stencil entries in the matrix. The boolean argument **symmetric** is applied to stencil entries on part **part** that couple variable **var** to variable **to_var**. A value of -1 may be used for **part**, **var**, or **to_var** to specify "all". For example, if **part** and **to_var** are set to -1, then the boolean is applied to stencil entries on all parts that couple variable **var** to all other variables.

By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

4.5.9

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructMatrix_Print ( bHYPRE_SStructMatrix self, const char*
filename, int32_t all, sidl_BaseInterface *_ex)
```

Print the matrix to file. This is mainly for debugging purposes.

4.5.10

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructMatrix_GetObject ( bHYPRE_SStructMatrix self,
sidl_BaseInterface* A, sidl_BaseInterface *_ex)
```

A semi-structured matrix or vector contains a Struct or IJ matrix or vector. GetObject returns it. The returned type is a sidl.BaseInterface. A cast must be used on the returned object to convert it into a known type.

4.5.11

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructMatrix_SetCommunicator ( bHYPRE_SStructMatrix self,
bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)
```

Set the MPI Communicator. DEPRECATED, Use Create()

4.5.12

```
SIDL_C_INLINE_DECL void
bHYPRE_SStructMatrix_Destroy ( bHYPRE_SStructMatrix self,
sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

4.5.13

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructMatrix_Assemble ( bHYPRE_SStructMatrix self,
sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with **Initialize** preceding **Assemble**. Values can only be set in between a call to **Initialize** and **Assemble**.

4.5.14

```
struct bHYPRE_SStructMatrix__object* bHYPRE_SStructMatrix__connectI const
char * url sidl_bool ar struct sidl_BaseInterface__object
**_ex
```

RMI connector function for the class. (no addref)

```

Print the vector to file. This is mainly for debugging purposes.

4.6.10

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructVector_GetObject ( bHYPRE_SStructVector self,
sidl_BaseInterface* A, sidl_BaseInterface *_ex)
```

A semi-structured matrix or vector contains a Struct or IJ matrix or vector. **GetObject** returns it. The returned type is a `sidl.BaseInterface`. A cast must be used on the returned object to convert it into a known type.

4.6.11

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructVector_SetCommunicator ( bHYPRE_SStructVector self,
bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)
```

4.6.12

```
SIDL_C_INLINE_DECL void
bHYPRE_SStructVector_Destroy ( bHYPRE_SStructVector self,
sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

4.6.13

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructVector_Assemble ( bHYPRE_SStructVector self,
sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with Initialize preceding Assemble. Values can only be set in between a call to Initialize and Assemble.

4.6.14

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructVector_Clone ( bHYPRE_SStructVector self,
bHYPRE_Vector* x, sidl_BaseInterface *_ex)
```

Create an **x** compatible with **self**. The new vector's data is not specified.

NOTE: When this method is used in an inherited class, the cloned **Vector** object can be cast to an object with the inherited class type.

*_ex)
```

Set matrix coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

If the matrix is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructParCSRMatrix_SetSymmetric (
    bHYPRE_SStructParCSRMatrix self, int32_t part, int32_t var, int32_t to_var,
    int32_t symmetric, sidl_BaseInterface *_ex)
```

Define symmetry properties for the stencil entries in the matrix. The boolean argument `symmetric` is applied to stencil entries on part `part` that couple variable `var` to variable `to_var`. A value of -1 may be used for `part`, `var`, or `to_var` to specify “all”. For example, if `part` and `to_var` are set to -1, then the boolean is applied to stencil entries on all parts that couple variable `var` to all other variables.

By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

4.7.9

```

Set vector coefficients index by index.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then **value** consists of a pair of doubles representing the real and imaginary parts of the complex value.

4.8.4

```

Set vector coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

If the vector is complex, then **values** consists of pairs of doubles representing the real and imaginary parts of each complex value.

SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructParCSRVector_GetObject (
  bHYPRE_SStructParCSRVector self, sidl_BaseInterface* A, sidl_BaseInterface

```

A semi-structured matrix or vector contains a Struct or IJ matrix or vector. **GetObject** returns it. The returned type is a `sidl.BaseInterface`. A cast must be used on the returned object to convert it into a known type.

4.8.11

```
SIDL_C_INLINE_DECL int32_t

4.8.12

```
SIDL_C_INLINE_DECL void
bHYPRE_SStructParCSRVector_Destroy ( bHYPRE_SStructParCSRVector
  self, sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

4.8.13

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructParCSRVector_Assemble ( bHYPRE_SStructParCSRVector
  self, sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with Initialize preceding Assemble. Values can only be set in between a call to Initialize and Assemble.

4.8.14

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructParCSRVector_Clone ( bHYPRE_SStructParCSRVector
  self, bHYPRE_Vector* x, sidl_BaseInterface *_ex)
```

Create an **x** compatible with **self**. The new vector's data is not specified.

NOTE: When this method is used in an inherited class, the cloned `Vector` object can be cast to an object with the inherited class type.

Hybrid solver first tries to solve with the specified Krylov solver, preconditioned by If that fails to converge, it will try again with the user-specified

Specify the preconditioner by calling SecondSolver's SetPreconditioner method. If no preconditioner is specified (equivalently, if the preconditioner for SecondSolver is IdentitySolver), the preconditioner for the second try will be one of the following defaults. StructMatrix: SMG. other matrix types: not implemented

The Hybrid solver's Setup method will call Setup on KrylovSolver, so the user should not call Setup on KrylovSolver.

```
struct bHYPRE_BoomerAMG__object
```

Symbol "bHYPRE.BoomerAMG" (version 1.0.0)

Algebraic multigrid solver, based on classical Ruge-Stueben.

BoomerAMG requires an IJParCSR matrix

The following optional parameters are available and may be set using the appropriate **Parameter** function (as indicated in parentheses):

MaxLevels (Int) - maximum number of multigrid levels.

StrongThreshold (Double) - AMG strength threshold.

MaxRowSum (Double) -

CoarsenType (Int) - type of parallel coarsening algorithm used.

MeasureType (Int) - type of measure used; local or global.

CycleType (Int) - type of cycle used; a V-cycle (default) or a W-cycle.

NumGridSweeps (IntArray 1D) - number of sweeps for fine and coarse grid, up and down cycle. DEPRECATED: Use NumSweeps or Cycle?NumSweeps instead.

NumSweeps (Int) - number of sweeps for fine grid, up and down cycle.

Cycle1NumSweeps (Int) - number of sweeps for down cycle

Cycle2NumSweeps (Int) - number of sweeps for up cycle

Cycle3NumSweeps (Int) - number of sweeps for coarse grid

GridRelaxType (IntArray 1D) - type of smoother used on fine and coarse grid, up and down cycle. DEPRECATED: Use RelaxType or Cycle?RelaxType instead.

RelaxType (Int) - type of smoother for fine grid, up and down cycle.

Cycle1RelaxType (Int) - type of smoother for down cycle

Cycle2RelaxType (Int) - type of smoother for up cycle

Cycle3RelaxType (Int) - type of smoother for coarse grid

GridRelaxPoints (IntArray 2D) - point ordering used in relaxation. DEPRECATED.

RelaxWeight (DoubleArray 1D) - relaxation weight for smoothed Jacobi and hybrid SOR. DEPRECATED: Instead, use the RelaxWt parameter and the SetLevelRelaxWt function.

RelaxWt (Int) - relaxation weight for all levels for smoothed Jacobi and hybrid SOR.

TruncFactor (Double) - truncation factor for interpolation.

JacobiTruncThreshold (Double) - threshold for truncation of Jacobi interpolation.

SmoothType (Int) - more complex smoothers.

SmoothNumLevels (Int) - number of levels for more complex smoothers.

SmoothNumSweeps (Int) - number of sweeps for more complex smoothers.

PrintFileName (String) - name of file printed to in association with **SetPrintLevel**.

NumFunctions (Int) - size of the system of PDEs (when using the systems version).

DOFFunc (IntArray 1D) - mapping that assigns the function to each variable (when using the systems version).

Variant (Int) - variant of Schwarz used.

Overlap (Int) - overlap for Schwarz.

DomainType (Int) - type of domain used for Schwarz.

SchwarzRlxWeight (Double) - the smoothing parameter for additive Schwarz.

Tolerance (Double) - convergence tolerance, if this is used as a solver; ignored if this is used as a preconditioner

DebugFlag (Int) -

InterpType (Int) - Defines which parallel interpolation operator is used. There are the following options for interp_type:

0	classical modified interpolation
1	LS interpolation (for use with GSMG)
2	classical modified interpolation for hyperbolic PDEs
3	direct interpolation (with separation of weights)
4	multipass interpolation
5	multipass interpolation (with separation of weights)
6	extended classical modified interpolation
7	extended (if no common C neighbor) classical modified interpolation
8	standard interpolation
9	standard interpolation (with separation of weights)
10	classical block interpolation (for use with nodal systems version only)
11	classical block interpolation (for use with nodal systems version only) with diagonalized diagonal blocks
12	FF interpolation
13	FF1 interpolation

The default is 0.

NumSamples (Int) - Defines the number of sample vectors used in GSMG or LS interpolation.

MaxIterations (Int) - maximum number of iterations

Logging (Int) - Set the *logging level*, specifying the degree of additional informational data to be accumulated. Does nothing by default (level = 0). Other levels (if any) are implementation-specific. Must be called before **Setup** and **Apply**.

PrintLevel (Int) - Set the *print level*, specifying the degree of informational data to be printed either to the screen or to a file. Does nothing by default (level=0). Other levels (if any) are implementation-specific. Must be called before **Setup** and **Apply**.

The following function is specific to this class:

SetLevelRlxWeight (Double , Int) - relaxation weight for one specified level of smoothed Jacobi and hybrid SOR.

Objects of this type can be cast to Solver objects using the `__cast` methods.

6.3.1

```
struct bHYPRE_Euclid__object
```

Symbol "bHYPRE.Euclid" (version 1.0.0)

Objects of this type can be cast to Solver objects using the `--cast` methods.

Although the usual Solver SetParameter functions are available, a Euclid-type parameter-setting function is also available, SetParameters.

6.3.2

```
bHYPRE_Euclid

7.1.1

```
struct bHYPRE_StructDiagScale__object
```

Symbol "bHYPRE.StructDiagScale" (version 1.0.0)

Diagonal scaling preconditioner for STruct matrix class.

Objects of this type can be cast to Solver objects using the `__cast` methods.

7.1.2

```
bHYPRE_StructDiagScale
bHYPRE_StructDiagScale__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

7.1.3

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructDiagScale_SetOperator ( bHYPRE_StructDiagScale self,
bHYPRE_Operator A, sidl_BaseInterface *_ex)
```

Set the operator for the linear system being solved. DEPRECATED. use Create

7.1.4

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructDiagScale_SetTolerance ( bHYPRE_StructDiagScale self,
double tolerance, sidl_BaseInterface *_ex)
```

(Optional) Set the convergence tolerance. DEPRECATED. use SetDoubleParameter

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructDiagScale_SetLogging ( bHYPRE_StructDiagScale self,
int32_t level, sidl_BaseInterface *_ex)
```

(Optional) Set the *logging level*, specifying the degree of additional informational data to be accumulated. Does nothing by default (level = 0). Other levels (if any) are implementation-specific. Must be called before **Setup** and **Apply**. DEPRECATED use **SetIntParameter**

7.1.7

```
SIDL_C_INLINE_DECL int32_t

10.4.1

```
struct bHYPRE_CGNR__object
```

Symbol "bHYPRE.CGNR" (version 1.0.0)

CGNR solver. This calls Babel-interface matrix and vector functions, so it will work with any consistent matrix, vector, and preconditioner classes.

10.4.2

```
bHYPRE_CGNR
bHYPRE_CGNR__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

10.4.3

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_CGNR_SetOperator ( bHYPRE_CGNR self, bHYPRE_Operator A,
sidl_BaseInterface *_ex)
```

Set the operator for the linear system being solved. DEPRECATED. use Create

10.4.4

```
SIDL_C_INLINE_DECL int32_t

```

(Optional) Set the *logging level*, specifying the degree of additional informational data to be accumulated. Does nothing by default (level = 0). Other levels (if any) are implementation-specific. Must be called before **Setup** and **Apply**. DEPRECATED use SetIntParameter

10.4.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_CGNR_SetPrintLevel ( bHYPRE_CGNR self, int32_t level,

```

(Optional) Set the *print level*, specifying the degree of informational data to be printed either to the screen or to a file. Does nothing by default (level=0). Other levels (if any) are implementation-specific. Must be called before **Setup** and **Apply**. DEPRECATED use SetIntParameter

10.4.8

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_CGNR_SetCommunicator ( bHYPRE_CGNR self,
bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)

****_ex**

RMI connector function for the class

248

12.1.1

```
struct bHYPRE_StructGrid__object
```

Symbol "bHYPRE.StructGrid" (version 1.0.0)

Define a structured grid class.

12.1.2

```
bHYPRE_StructGrid
bHYPRE_StructGrid__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

12.1.3

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructGrid.SetCommunicator ( bHYPRE_StructGrid self,
bHYPRE_MPICommunicator mpi_comm, sidl_BaseInterface *_ex)
```

Set the MPI Communicator. DEPRECATED, use Create:

12.1.4

```
SIDL_C_INLINE_DECL void
bHYPRE_StructGrid_Destroy ( bHYPRE_StructGrid self, sidl_BaseInterface
*_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

12.1.5

```
int32_t
bHYPRE_StructGrid_SetExtents ( bHYPRE_StructGrid self, int32_t* ilower,
int32_t* iupper, int32_t dim, sidl_BaseInterface *_ex)
```

Define the lower and upper corners of a box of the grid. "ilower" and "iupper" are arrays of size "dim", the number of spatial dimensions.

12.1.6

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructGrid_SetPeriodic ( bHYPRE_StructGrid self, int32_t*
periodic, int32_t dim, sidl_BaseInterface *_ex)
```

Set the periodicity for the grid. Default is no periodicity.

The argument **periodic** is an **dim**-dimensional integer array that contains the periodicity for each dimension. A zero value for a dimension means non-periodic, while a nonzero value means periodic and contains the actual period. For example, periodicity in the first and third dimensions for a 10x11x12 grid is indicated by the array [10,0,12].

NOTE: Some of the solvers in hypre have power-of-two restrictions on the size of the periodic dimensions.

12.1.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_StructGrid_SetNumGhost ( bHYPRE_StructGrid self, int32_t*
num_ghost, int32_t dim2, sidl_BaseInterface *_ex)
```

Set the number of ghost zones, separately on the lower and upper sides for each dimension. "num_ghost" is an array of size "dim2", twice the number of dimensions.

12.1.8

```
struct bHYPRE_StructGrid__object* bHYPRE_StructGrid__connectI const char *
url sidl_bool ar struct sidl_BaseInterface__object
**_ex
```

RMI connector function for the class. (no addrf)

12.2.1

```
struct bHYPRE_StructStencil__object
```

Symbol "bHYPRE.StructStencil" (version 1.0.0)

Define a structured stencil for a structured problem description. More than one implementation is not envisioned, thus the decision has been made to make this a class rather than an interface.

12.2.2

```
bHYPRE_StructStencil
bHYPRE_StructStencil__connect (const char *, sidl_BaseInterface *_ex)
```

RMI connector function for the class.(addrefs)

12.2.3

```
bHYPRE_StructStencil
bHYPRE_StructStencil__Create ( int32_t ndim, int32_t size, sidl_BaseInterface
*_ex)
```

This function is the preferred way to create a Struct Stencil. You provide the number of spatial dimensions and the number of stencil entries.

12.2.4

```
SIDL_C_INLINE_DECL void
bHYPRE_StructStencil_Destroy ( bHYPRE_StructStencil self,
sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

12.2.5

```
SIDL_C_INLINE_DECL int32_t

index, int32_t* offset, int32_t dim, sidl_BaseInterface *_ex)
```

Set a stencil element. Specify the stencil index, and an array of offsets. "offset" is an array of length "dim", the number of spatial dimensions.

12.2.8

```
struct bHYPRE_StructStencil__object* bHYPRE_StructStencil__connectI const char

sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

13.1.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructGraph_Assemble ( bHYPRE_SStructGraph self,
sidl_BaseInterface *_ex)
```

Finalize the construction of an object before using, either for the first time or on subsequent uses. **Initialize** and **Assemble** always appear in a matched set, with Initialize preceding Assemble. Values can only be set in between a call to Initialize and Assemble.

13.2.3

```
SIDL_C_INLINE_DECL void
bHYPRE_SStructGrid_Destroy ( bHYPRE_SStructGrid self,
sidl_BaseInterface *_ex)
```

The Destroy function doesn't necessarily destroy anything. It is just another name for deleteRef. Thus it decrements the object's reference count. The Babel memory management system will destroy the object if the reference count goes to zero.

13.2.4

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructGrid_SetVariable ( bHYPRE_SStructGrid self, int32_t part,
int32_t var, int32_t nvars, enum bHYPRE_SStructVariable__enum vartype,
sidl_BaseInterface *_ex)
```

Describe the variables that live on a structured part of the grid. Input: part number, variable number, total number of variables on that part (needed for memory allocation), variable type.

13.2.5

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructGrid_AddVariable ( bHYPRE_SStructGrid self, int32_t
part, int32_t* index, int32_t dim, int32_t var, enum
bHYPRE_SStructVariable__enum vartype, sidl_BaseInterface *_ex)
```

Describe additional variables that live at a particular index. These variables are appended to the array of variables set in **SetVariables**, and are referenced as such.

13.2.6

```
int32_t
bHYPRE_SStructGrid_SetNeighborBox ( bHYPRE_SStructGrid self, int32_t
part, int32_t* ilower, int32_t* iupper, int32_t nbor_part, int32_t* nbor_ilower,
int32_t* nbor_iupper, int32_t* index_map, int32_t dim, sidl_BaseInterface *_ex)
```

Describe how regions just outside of a part relate to other parts. This is done a box at a time.

The indexes `ilower` and `iupper` map directly to the indexes `nbor_ilower` and `nbor_iupper`. Although, it is required that indexes increase from `ilower` to `iupper`, indexes may increase and/or decrease from `nbor_ilower` to `nbor_iupper`.

The `index_map` describes the mapping of indexes 0, 1, and 2 on part `part` to the corresponding indexes on part `nbor_part`. For example, triple (1, 2, 0) means that indexes 0, 1, and 2 on part `part` map to indexes 1, 2, and 0 on part `nbor_part`, respectively.

NOTE: All parts related to each other via this routine must have an identical list of variables and variable types. For example, if part 0 has only two variables on it, a cell centered variable and a node centered variable, and we declare part 1 to be a neighbor of part 0, then part 1 must also have only two variables on it, and they must be of type cell and node.

13.2.7

```
SIDL_C_INLINE_DECL int32_t
bHYPRE_SStructGrid_AddUnstructuredPart ( bHYPRE_SStructGrid self,
int32_t ilower, int32_t iupper, sidl_BaseInterface *_ex)
```

Add an unstructured part to the grid. The variables in the unstructured part of the grid are referenced by a global rank between 0 and the total number of unstructured variables minus one. Each process owns some unique consecutive range of variables, defined by `ilower` and `iupper`.

NOTE: This is just a placeholder. This part of the interface is not finished.

Semi-Structured Variable

Names

13.4.1 enum **bHYPRE_SStructVariable__enum**

<i>Symbol "bHYPRE"</i>	266
------------------------------	-----

13.4.1

```
enum bHYPRE_SStructVariable__enum
```

Symbol "bHYPRE.SStructVariable" (version 1.0.0)

The SStructVariable enumerated type.

An enumerated type that supports cell centered, node centered, face centered, and edge centered variables. Face centered variables are split into x-face, y-face, and z-face variables, and edge centered variables are split into x-edge, y-edge, and z-edge variables. The edge centered variable types are only used in 3D. In 2D, edge centered variables are handled by the face centered types.

Variables are referenced relative to an abstract (cell centered) index in the following way:

- cell centered variables are aligned with the index;
- node centered variables are aligned with the cell corner at relative index (1/2, 1/2, 1/2);
- x-face, y-face, and z-face centered variables are aligned with the faces at relative indexes (1/2, 0, 0), (0, 1/2, 0), and (0, 0, 1/2), respectively;
- x-edge, y-edge, and z-edge centered variables are aligned with the edges at relative indexes (0, 1/2, 1/2), (1/2, 0, 1/2), and (1/2, 1/2, 0), respectively.

The supported identifiers are:

- HYPRE_SSTRUCT_VARIABLE_CELL
- HYPRE_SSTRUCT_VARIABLE_NODE
- HYPRE_SSTRUCT_VARIABLE_XFACE
- HYPRE_SSTRUCT_VARIABLE_YFACE
- HYPRE_SSTRUCT_VARIABLE_ZFACE
- HYPRE_SSTRUCT_VARIABLE_XEDGE
- HYPRE_SSTRUCT_VARIABLE_YEDGE
- HYPRE_SSTRUCT_VARIABLE_ZEDGE

NOTE: Although variables are referenced relative to a unique abstract cell-centered index, some variables are associated with multiple grid cells. For example, node centered variables in 3D are associated with 8 cells (away from boundaries). Although grid cells are distributed uniquely to different processes, variables may be owned by multiple processes because they may be associated with multiple cells.
