Names		
1.1	Struct Grids	
		5
1.2	Struct Stencils	
		8
1.3	Struct Matrices	
		9
1.4	Struct Vectors	
		16

This interface represents a structured-grid conceptual view of a linear system.

\_ 1.1 \_

# Struct Grids

Names		
1.1.1	typedef struct hypre_StructGrid_struct *HYPRE_StructGrid  A grid object is constructed out of several "boxes", defined on a global abstract index space	6
1.1.2	int  HYPRE_StructGridCreate (MPI_Comm comm, int ndim,  HYPRE_StructGrid* grid)  Create an ndim-dimensional grid object	6
1.1.3	int HYPRE_StructGridDestroy (HYPRE_StructGrid grid)  Destroy a grid object	6
1.1.4	int  HYPRE_StructGridSetExtents (HYPRE_StructGrid grid, int* ilower,	7
1.1.5	int  HYPRE_StructGridAssemble (HYPRE_StructGrid grid)  Finalize the construction of the grid before using	7
1.1.6	$\operatorname{int}$	

111

typedef struct hypre\_StructGrid\_struct \*HYPRE\_StructGrid

A grid object is constructed out of several "boxes", defined on a global abstract index space

### 1.1.2 \_

HYPRE\_StructGridCreate (MPI\_Comm comm, int ndim, HYPRE\_StructGrid\* grid)

Create an ndim-dimensional grid object

## 1.1.3

int HYPRE\_StructGridDestroy (HYPRE\_StructGrid grid)

Destroy a grid object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

1.1.4

int **HYPRE\_StructGridSetExtents** (HYPRE\_StructGrid grid, int\* ilower, int\* iupper)

Set the extents for a box on the grid

\_ 1.1.5 \_

int HYPRE\_StructGridAssemble (HYPRE\_StructGrid grid)

Finalize the construction of the grid before using

\_ 1.1.6 \_

int HYPRE\_StructGridSetPeriodic (HYPRE\_StructGrid grid, int\* periodic)

Set the periodicity for the grid.

The argument periodic is an ndim-dimensional integer array that contains the periodicity for each dimension. A zero value for a dimension means non-periodic, while a nonzero value means periodic and contains the actual period. For example, periodicity in the first and third dimensions for a 10x11x12 grid is indicated by the array [10,0,12].

NOTE: Some of the solvers in hypre have power-of-two restrictions on the size of the periodic dimensions.

\_ 1.1.7 \_

int HYPRE\_StructGridSetNumGhost (HYPRE\_StructGrid grid, int\* num\_ghost)

Set the ghost layer in the grid object

1.2

# **Struct Stencils**

names		
1.2.1	typedef struct hypre_StructStencil_struct *HYPRE_StructStencil	0
	The stencil object	8
1.2.2	$\operatorname{int}$	
	HYPRE_StructStencilCreate (int ndim, int size,	
	HYPRE_StructStencil* stencil)	
	Create a stencil object for the specified number of spatial dimensions and	
	stencil entries	8
1.2.3	$\operatorname{int}$	
	HYPRE_StructStencilDestroy (HYPRE_StructStencil stencil)	
	Destroy a stencil object	9
1.2.4	$\operatorname{int}$	
	HYPRE_StructStencilSetElement (HYPRE_StructStencil stencil, int entry,	
	int* offset)	
	Set a stencil entry.	9

1.2.1

 $typedef\ struct\ hypre\_StructStencil\_struct\ *HYPRE\_StructStencil$ 

The stencil object

1.2.2

int

HYPRE\_StructStencilCreate (int ndim, int size, HYPRE\_StructStencil\* stencil)

Create a stencil object for the specified number of spatial dimensions and stencil entries

#### 1.2.3

# int HYPRE\_StructStencilDestroy (HYPRE\_StructStencil stencil)

Destroy a stencil object

#### 1.2.4

int

HYPRE\_StructStencilSetElement (HYPRE\_StructStencil stencil, int entry, int\* offset)

Set a stencil entry.

NOTE: The name of this routine will eventually be changed to  ${\tt HYPRE\_StructStencilSetEntry}.$ 

#### 1.3

# **Struct Matrices**

Names	
1.3.1 typedef struct hypre_StructMatrix_struct *HYPRE_StructMatrix  The matrix object	. 11
1.3.2 int  HYPRE_StructMatrixCreate (MPI_Comm comm, HYPRE_StructGrid grid,  HYPRE_StructStencil stencil,  HYPRE_StructMatrix* matrix)  Create a matrix object	. 11
	. 11
1.3.3 int  HYPRE_StructMatrixDestroy (HYPRE_StructMatrix matrix)  Destroy a matrix object	. 11
1.3.4 int	
HYPRE_StructMatrixInitialize (HYPRE_StructMatrix matrix)  Prepare a matrix object for setting coefficient values	. 12
1.3.5 int	
HYPRE_StructMatrixSetValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, HYPRE_Complex* values)  Set matrix coefficients index by index	. 12
1.3.6 int	

	HYPRE_StructMatrixAddToValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, HYPRE_Complex* values)	
	Add to matrix coefficients index by index	12
1.3.7	$\operatorname{int}$	
	HYPRE_StructMatrixSetConstantValues (HYPRE_StructMatrix matrix, int nentries, int* entries, HYPRE_Complex* values)	
	Set matrix coefficients which are constant over the grid	12
1.3.8	int HYPRE_StructMatrixAddToConstantValues (HYPRE_StructMatrix matrix, int nentries,	
	int* entries,  HYPRE_Complex* values)	
	Add to matrix coefficients which are constant over the grid	13
1.3.9	int HYPRE_StructMatrixSetBoxValues (HYPRE_StructMatrix matrix, int* ilower, int* iupper, int nentries, int* entries, HYPRE_Complex* values)	
	Set matrix coefficients a box at a time	13
1.3.10	int  HYPRE_StructMatrixAddToBoxValues (HYPRE_StructMatrix matrix,	
	Add to matrix coefficients a box at a time.	13
1.3.11	int HYPRE_StructMatrixAssemble (HYPRE_StructMatrix matrix)  Finalize the construction of the matrix before using	14
1.3.12	int HYPRE_StructMatrixGetValues (HYPRE_StructMatrix matrix, int* index, int nentries, int* entries, HYPRE_Complex* values)	
	Get matrix coefficients index by index.	14
1.3.13	int HYPRE_StructMatrixGetBoxValues (HYPRE_StructMatrix matrix, int* ilower, int* iupper, int nentries, int* entries, HYPRE_Complex* values)	
	Get matrix coefficients a box at a time	14
1.3.14	int	
1.0.11	HYPRE_StructMatrixSetSymmetric (HYPRE_StructMatrix matrix, int symmetric)	
	Define symmetry properties of the matrix.	14
1.3.15	int HYPRE_StructMatrixSetConstantEntries (HYPRE_StructMatrix matrix, int nentries, int* entries)	
	Specify which stencil entries are constant over the grid	15
1.3.16	$\operatorname{int}$	

	HYPRE_StructMatrixSetNumGhost (HYPRE_StructMatrix matrix,	
	int* num_ghost)	
	Set the ghost layer in the matrix	15
1.3.17	$\operatorname{int}$	
	HYPRE_StructMatrixPrint (const char* filename,	
	HYPRE_StructMatrix matrix, int all)	
	Print the matrix to file.	15
1.3.18	$\operatorname{int}$	
	HYPRE_StructMatrixMatvec ( HYPRE_Complex alpha,	
	HYPRE_StructMatrix A,	
	HYPRE_StructVector x,	
	HYPRE_Complex beta,	
	HYPRE_StructVector y )	
	Matvec operator	16

 $typedef\ struct\ hypre\_StructMatrix\_struct\ *HYPRE\_StructMatrix$ 

The matrix object

\_ 1.3.2 \_

int

HYPRE\_StructMatrixCreate (MPI\_Comm comm, HYPRE\_StructGrid grid, HYPRE\_StructStencil stencil, HYPRE\_StructMatrix\* matrix)

Create a matrix object

\_ 1.3.3 \_

int HYPRE\_StructMatrixDestroy (HYPRE\_StructMatrix matrix)

Destroy a matrix object

int **HYPRE\_StructMatrixInitialize** (HYPRE\_StructMatrix matrix)

Prepare a matrix object for setting coefficient values

### \_ 1.3.5 \_\_

int

**HYPRE\_StructMatrixSetValues** (HYPRE\_StructMatrix matrix, int\* index, int nentries, int\* entries, HYPRE\_Complex\* values)

Set matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_StructMatrixSetBoxValues to set coefficients a box at a time.

#### 1.3.6

int

HYPRE\_StructMatrixAddToValues (HYPRE\_StructMatrix matrix, int\* index, int nentries, int\* entries, HYPRE\_Complex\* values)

Add to matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_StructMatrixAddToBoxValues to set coefficients a box at a time.

# \_ 1.3.7 \_

int

**HYPRE\_StructMatrixSetConstantValues** (HYPRE\_StructMatrix matrix, int nentries, int\* entries, HYPRE\_Complex\* values)

Set matrix coefficients which are constant over the grid. The values array is of length nentries.

int

 $\label{lem:hypre_structMatrix} \begin{tabular}{ll} HYPRE\_StructMatrix Matrix, int nentries, int* entries, HYPRE\_Complex* values) \end{tabular}$ 

Add to matrix coefficients which are constant over the grid. The values array is of length nentries.

### \_\_ 1.3.9 \_\_

int

HYPRE\_StructMatrixSetBoxValues (HYPRE\_StructMatrix matrix, int\* ilower, int\* iupper, int nentries, int\* entries, HYPRE\_Complex\* values)

Set matrix coefficients a box at a time. The data in values is ordered as follows:

```
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
    for (j = ilower[1]; j <= iupper[1]; j++)
        for (i = ilower[0]; i <= iupper[0]; i++)
            for (entry = 0; entry < nentries; entry++)
        {
            values[m] = ...;
            m++;
        }
}</pre>
```

### 1.3.10

int

HYPRE\_StructMatrixAddToBoxValues (HYPRE\_StructMatrix matrix, int\* ilower, int\* iupper, int nentries, int\* entries, HYPRE\_Complex\* values)

Add to matrix coefficients a box at a time. The data in values is ordered as in HYPRE\_StructMatrixSetBoxValues.

int HYPRE\_StructMatrixAssemble (HYPRE\_StructMatrix matrix)

Finalize the construction of the matrix before using

## \_\_\_ 1.3.12 \_\_\_\_

int

HYPRE\_StructMatrixGetValues (HYPRE\_StructMatrix matrix, int\* index, int nentries, int\* entries, HYPRE\_Complex\* values)

Get matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_StructMatrixGetBoxValues to get coefficients a box at a time.

## \_ 1.3.13 \_\_\_\_\_

int

**HYPRE\_StructMatrixGetBoxValues** (HYPRE\_StructMatrix matrix, int\* ilower, int\* iupper, int nentries, int\* entries, HYPRE\_Complex\* values)

Get matrix coefficients a box at a time. The data in values is ordered as in HYPRE\_StructMatrixSetBoxValues.

### 1.3.14

int

 $\label{eq:hypre_structMatrixSetSymmetric} \textbf{(HYPRE\_StructMatrix matrix, int symmetric)}$ 

Define symmetry properties of the matrix. By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

int

 $\label{thm:hypre_structMatrixSetConstantEntries} \mbox{ ( HYPRE\_StructMatrix matrix, int nentries, int* entries )}$ 

Specify which stencil entries are constant over the grid. Declaring entries to be "constant over the grid" yields significant memory savings because the value for each declared entry will only be stored once. However, not all solvers are able to utilize this feature.

Presently supported:

- no entries constant (this function need not be called)
- all entries constant
- all but the diagonal entry constant

\_ 1.3.16 \_

ınt

**HYPRE\_StructMatrixSetNumGhost** (HYPRE\_StructMatrix matrix, int\* num\_ghost)

Set the ghost layer in the matrix

\_ 1.3.17 \_\_

int

**HYPRE\_StructMatrixPrint** (const char\* filename, HYPRE\_StructMatrix matrix, int all)

Print the matrix to file. This is mainly for debugging purposes.

int

**HYPRE\_StructMatrixMatvec** ( HYPRE\_Complex alpha, HYPRE\_StructMatrix A, HYPRE\_StructVector x, HYPRE\_Complex beta, HYPRE\_StructVector y )

Matvec operator. This operation is  $y = \alpha Ax + \beta y$ . Note that you can do a simple matrix-vector multiply by setting  $\alpha = 1$  and  $\beta = 0$ .

# \_ 1.4 \_

# Struct Vectors

Names		
1.4.1	typedef struct hypre_StructVector_struct *HYPRE_StructVector  The vector object	17
1.4.2	int	
1.4.2	HYPRE_StructVectorCreate (MPI_Comm comm, HYPRE_StructGrid grid, HYPRE_StructVector* vector)	
	Create a vector object	17
1.4.3	$\operatorname{int}$	
	HYPRE_StructVectorDestroy (HYPRE_StructVector vector)  Destroy a vector object	17
1.4.4	int	
	HYPRE_StructVectorInitialize (HYPRE_StructVector vector)	
	Prepare a vector object for setting coefficient values	18
1.4.5	int	
	HYPRE_StructVectorSetValues (HYPRE_StructVector vector, int* index, HYPRE_Complex value)	
	Set vector coefficients index by index.	18
1.4.6	int	
	HYPRE_StructVectorAddToValues (HYPRE_StructVector vector, int* index, HYPRE_Complex value)	
	Add to vector coefficients index by index	18
1.4.7	int	
	HYPRE_StructVectorSetBoxValues (HYPRE_StructVector vector, int* ilower, int* iupper, HYPRE_Complex* values)	
	Set vector coefficients a box at a time.	18
1.4.8	int	
1.4.0	HYPRE_StructVectorAddToBoxValues (HYPRE_StructVector vector, int* ilower, int* iupper, HYPRE_Complex* values)	
	Add to vector coefficients a box at a time	19
1.4.0	•	10
1.4.9	$\operatorname{int}$	

	HYPRE_StructVectorAssemble (HYPRE_StructVector vector)	
	Finalize the construction of the vector before using	19
1.4.10	$\operatorname{int}$	
	HYPRE_StructVectorGetValues (HYPRE_StructVector vector, int* index,	
	HYPRE_Complex* value)	
	Get vector coefficients index by index.	19
1.4.11	$\operatorname{int}$	
	HYPRE_StructVectorGetBoxValues (HYPRE_StructVector vector,	
	int* ilower, int* iupper,	
	HYPRE_Complex* values)	
	Get vector coefficients a box at a time.	20
1.4.12	$\operatorname{int}$	
	HYPRE_StructVectorPrint (const char* filename,	
	HYPRE_StructVector vector, int all)	
	Print the vector to file	20

1.4.1

typedef struct hypre\_StructVector\_struct \*HYPRE\_StructVector

The vector object

1.4.2

HYPRE\_StructVectorCreate (MPI\_Comm comm, HYPRE\_StructGrid grid, HYPRE\_StructVector\* vector)

Create a vector object

1.4.3

int HYPRE\_StructVectorDestroy (HYPRE\_StructVector vector)

Destroy a vector object

1.4.4

int HYPRE\_StructVectorInitialize (HYPRE\_StructVector vector)

Prepare a vector object for setting coefficient values

\_\_ 1.4.5 \_\_\_\_

HYPRE\_StructVectorSetValues (HYPRE\_StructVector vector, int\* index, HYPRE\_Complex value)

Set vector coefficients index by index.

NOTE: For better efficiency, use HYPRE\_StructVectorSetBoxValues to set coefficients a box at a time.

1.4.6

HYPRE\_StructVectorAddToValues (HYPRE\_StructVector vector, int\* index, HYPRE\_Complex value)

Add to vector coefficients index by index.

NOTE: For better efficiency, use HYPRE\_StructVectorAddToBoxValues to set coefficients a box at a time.

\_ 1.4.7 \_\_\_\_

HYPRE\_StructVectorSetBoxValues (HYPRE\_StructVector vector, int\* ilower, int\* iupper, HYPRE\_Complex\* values)

Set vector coefficients a box at a time. The data in values is ordered as follows:

```
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
  for (j = ilower[1]; j <= iupper[1]; j++)
    for (i = ilower[0]; i <= iupper[0]; i++)
    {
      values[m] = ...;
      m++;
    }</pre>
```

## \_ 1.4.8 \_

int

**HYPRE\_StructVectorAddToBoxValues** (HYPRE\_StructVector vector, int\* ilower, int\* iupper, HYPRE\_Complex\* values)

Add to vector coefficients a box at a time. The data in values is ordered as in HYPRE\_StructVectorSetBoxValues.

### 1.4.9

int HYPRE\_StructVectorAssemble (HYPRE\_StructVector vector)

Finalize the construction of the vector before using

### 1.4.10

HYPRE\_StructVectorGetValues (HYPRE\_StructVector vector, int\* index, HYPRE\_Complex\* value)

Get vector coefficients index by index.

NOTE: For better efficiency, use HYPRE\_StructVectorGetBoxValues to get coefficients a box at a time.

#### 1.4.11

HYPRE\_StructVectorGetBoxValues (HYPRE\_StructVector vector, int\* ilower, int\* iupper, HYPRE\_Complex\* values)

Get vector coefficients a box at a time. The data in values is ordered as in HYPRE\_StructVectorSetBoxValues.

# \_\_\_ 1.4.12 \_\_\_\_\_

HYPRE\_StructVectorPrint (const char\* filename, HYPRE\_StructVector vector, int all)

Print the vector to file. This is mainly for debugging purposes.

## 2.1.1

typedef struct hypre\_SStructGrid\_struct \*HYPRE\_SStructGrid

A grid object is constructed out of several structured "parts" and an optional unstructured "part". Each structured part has its own abstract index space.

#### 2.1.2

typedef int HYPRE\_SStructVariable

An enumerated type that supports cell centered, node centered, face centered, and edge centered variables. Face centered variables are split into x-face, y-face, and z-face variables, and edge centered variables are split into x-edge, y-edge, and z-edge variables. The edge centered variable types are only used in 3D. In 2D, edge centered variables are handled by the face centered types.

Variables are referenced relative to an abstract (cell centered) index in the following way:

- cell centered variables are aligned with the index;
- node centered variables are aligned with the cell corner at relative index (1/2, 1/2, 1/2);
- x-face, y-face, and z-face centered variables are aligned with the faces at relative indexes (1/2, 0, 0), (0, 1/2, 0), and (0, 0, 1/2), respectively;
- x-edge, y-edge, and z-edge centered variables are aligned with the edges at relative indexes (0, 1/2, 1/2), (1/2, 0, 1/2), and (1/2, 1/2, 0), respectively.

The supported identifiers are:

- HYPRE\_SSTRUCT\_VARIABLE\_CELL
- HYPRE\_SSTRUCT\_VARIABLE\_NODE
- HYPRE\_SSTRUCT\_VARIABLE\_XFACE
- HYPRE\_SSTRUCT\_VARIABLE\_YFACE
- HYPRE\_SSTRUCT\_VARIABLE\_ZFACE
- HYPRE\_SSTRUCT\_VARIABLE\_XEDGE
- HYPRE\_SSTRUCT\_VARIABLE\_YEDGE
- HYPRE\_SSTRUCT\_VARIABLE\_ZEDGE

NOTE: Although variables are referenced relative to a unique abstract cell-centered index, some variables are associated with multiple grid cells. For example, node centered variables in 3D are associated with 8 cells (away from boundaries). Although grid cells are distributed uniquely to different processes, variables may be owned by multiple processes because they may be associated with multiple cells.

 $\_$  2.1.3  $\_$ 

HYPRE\_SStructGridCreate (MPI\_Comm comm, int ndim, int nparts, HYPRE\_SStructGrid\* grid)

Create an ndim-dimensional grid object with nparts structured parts

 $\_$  2.1.4  $\_$ 

int HYPRE\_SStructGridDestroy (HYPRE\_SStructGrid grid)

Destroy a grid object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

 $_{-}$  2.1.5  $_{-}$ 

HYPRE\_SStructGridSetExtents (HYPRE\_SStructGrid grid, int part, int\* ilower, int\* iupper)

Set the extents for a box on a structured part of the grid

#### 2.1.6

HYPRE\_SStructGridSetVariables (HYPRE\_SStructGrid grid, int part, int nvars, HYPRE\_SStructVariable\* vartypes)

Describe the variables that live on a structured part of the grid

#### 2.1.7

HYPRE\_SStructGridAddVariables (HYPRE\_SStructGrid grid, int part, int\* index, int nvars, HYPRE\_SStructVariable\* vartypes)

Describe additional variables that live at a particular index. These variables are appended to the array of variables set in HYPRE\_SStructGridSetVariables, and are referenced as such.

NOTE: This routine is not yet supported.

# 2.1.8

int **HYPRE\_SStructGridSetFEMOrdering** (HYPRE\_SStructGrid grid, int part, int\* ordering)

Set the ordering of variables in a finite element problem. This overrides the default ordering described below.

Array ordering is composed of blocks of size (1 + ndim). Each block indicates a specific variable in the element and the ordering of the blocks defines the ordering of the variables. A block contains a variable number followed by an offset direction relative to the element's center. For example, a block containing (2, 1, -1, 0) means variable 2 on the edge located in the (1, -1, 0) direction from the center of the element. Note that here variable 2 must be of type ZEDGE for this to make sense. The ordering array must account for all variables in the element. This routine can only be called after HYPRE\_SStructGridSetVariables.

The default ordering for element variables (var, i, j, k) varies fastest in index i, followed by j, then k, then var. For example, if var 0, var 1, and var 2 are declared to be XFACE, YFACE, and NODE variables, respectively, then the default ordering (in 2D) would first list the two XFACE variables, then the two YFACE variables, then the four NODE variables as follows:

(0,-1,0), (0,1,0), (1,0,-1), (1,0,1), (2,-1,-1), (2,1,-1), (2,-1,1), (2,1,1)

#### 2.1.9

int

HYPRE\_SStructGridSetNeighborPart (HYPRE\_SStructGrid grid, int part, int\* ilower, int\* iupper, int nbor\_part, int\* nbor\_ilower, int\* nbor\_iupper, int\* index\_map, int\* index\_dir)

Describe how regions just outside of a part relate to other parts. This is done a box at a time.

Parts part and nbor\_part must be different, except in the case where only cell-centered data is used.

Indexes should increase from ilower to iupper. It is not necessary that indexes increase from nbor\_ilower to nbor\_iupper.

The index\_map describes the mapping of indexes 0, 1, and 2 on part part to the corresponding indexes on part nbor\_part. For example, triple (1, 2, 0) means that indexes 0, 1, and 2 on part part map to indexes 1, 2, and 0 on part nbor\_part, respectively.

The index\_dir describes the direction of the mapping in index\_map. For example, triple (1, 1, -1) means that for indexes 0 and 1, increasing values map to increasing values on nbor\_part, while for index 2, decreasing values map to increasing values.

NOTE: All parts related to each other via this routine must have an identical list of variables and variable types. For example, if part 0 has only two variables on it, a cell centered variable and a node centered variable, and we declare part 1 to be a neighbor of part 0, then part 1 must also have only two variables on it, and they must be of type cell and node. In addition, variables associated with FACEs or EDGEs must be grouped together and listed in X, Y, Z order. This is to enable the code to correctly associate variables on one part with variables on its neighbor part when a coordinate transformation is specified. For example, an XFACE variable on one part may correspond to a YFACE variable on a neighbor part under a particular transformation, and the code determines this association by assuming that the variable lists are as noted here.

# 2.1.10

int

HYPRE\_SStructGridSetSharedPart (HYPRE\_SStructGrid grid, int part, int\* ilower, int\* iupper, int\* offset, int shared\_part, int\* shared\_ilower, int\* shared\_ilower, int\* shared\_offset, int\* index\_map, int\* index\_dir)

Describe how regions inside a part are shared with regions in other parts.

Parts part and shared\_part must be different.

Indexes should increase from ilower to iupper. It is not necessary that indexes increase from shared\_ilower to shared\_iupper. This is to maintain consistency with the SetNeighborPart function, which is also able

to describe shared regions but in a more limited fashion.

The offset is a triple (in 3D) used to indicate the dimensionality of the shared set of data and its position with respect to the box extents ilower and iupper on part part. The dimensionality is given by the number of 0's in the triple, and the position is given by plus or minus 1's. For example: (0, 0, 0) indicates sharing of all data in the given box; (1, 0, 0) indicates sharing of data on the faces in the (1, 0, 0) direction; (1, 0, -1) indicates sharing of data on the edges in the (1, 0, -1) direction; and (1, -1, 1) indicates sharing of data on the nodes in the (1, -1, 1) direction. To ensure the dimensionality, it is required that for every nonzero entry, the corresponding extents of the box are the same. For example, if offset is (0, 1, 0), then (2, 1, 3) and (10, 1, 15) are valid box extents, whereas (2, 1, 3) and (10, 7, 15) are invalid (because 1 and 7 are not the same).

The shared\_offset is used in the same way as offset, but with respect to the box extents shared\_ilower and shared\_iupper on part shared\_part.

The index\_map describes the mapping of indexes 0, 1, and 2 on part part to the corresponding indexes on part shared\_part. For example, triple (1, 2, 0) means that indexes 0, 1, and 2 on part part map to indexes 1, 2, and 0 on part shared\_part, respectively.

The index\_dir describes the direction of the mapping in index\_map. For example, triple (1, 1, -1) means that for indexes 0 and 1, increasing values map to increasing values on shared\_part, while for index 2, decreasing values map to increasing values.

NOTE: All parts related to each other via this routine must have an identical list of variables and variable types. For example, if part 0 has only two variables on it, a cell centered variable and a node centered variable, and we declare part 1 to have shared regions with part 0, then part 1 must also have only two variables on it, and they must be of type cell and node. In addition, variables associated with FACEs or EDGEs must be grouped together and listed in X, Y, Z order. This is to enable the code to correctly associate variables on one part with variables on a shared part when a coordinate transformation is specified. For example, an XFACE variable on one part may correspond to a YFACE variable on a shared part under a particular transformation, and the code determines this association by assuming that the variable lists are as noted here.

### 2.1.11

HYPRE\_SStructGridAddUnstructuredPart (HYPRE\_SStructGrid grid, int ilower, int iupper)

Add an unstructured part to the grid. The variables in the unstructured part of the grid are referenced by a global rank between 0 and the total number of unstructured variables minus one. Each process owns some unique consecutive range of variables, defined by ilower and iupper.

NOTE: This is just a placeholder. This part of the interface is not finished.

2.1.12

int HYPRE\_SStructGridAssemble (HYPRE\_SStructGrid grid)

Finalize the construction of the grid before using

\_ 2.1.13 \_\_\_\_

HYPRE\_SStructGridSetPeriodic (HYPRE\_SStructGrid grid, int part, int\* periodic)

Set the periodicity on a particular part.

The argument periodic is an ndim-dimensional integer array that contains the periodicity for each dimension. A zero value for a dimension means non-periodic, while a nonzero value means periodic and contains the actual period. For example, periodicity in the first and third dimensions for a 10x11x12 part is indicated by the array [10,0,12].

NOTE: Some of the solvers in hypre have power-of-two restrictions on the size of the periodic dimensions.

2.1.14

int **HYPRE\_SStructGridSetNumGhost** (HYPRE\_SStructGrid grid, int\* num\_ghost)

Setting ghost in the sgrids

2.2

**SStruct Stencils** 

### Names

2.2.1 typedef struct hypre\_SStructStencil\_struct \*HYPRE\_SStructStencil

	The stencil object	29
2.2.2	int	
	HYPRE_SStructStencilCreate (int ndim, int size,	
	HYPRE_SStructStencil* stencil)	
	Create a stencil object for the specified number of spatial dimensions and	
	stencil entries	29

	$int^* sparsity)$	
	Set the finite element stiffness matrix sparsity.	32
2.3.8	$\operatorname{int}$	

	HYPRE_SStructGraphAddEntries (HYPRE_SStructGraph graph, int part, int* index, int var, int to_part,	
	int* to_index, int to_var)	
	Add a non-stencil graph entry at a particular index	33
2.3.9	$\operatorname{int}$	
	HYPRE_SStructGraphAssemble (HYPRE_SStructGraph graph)	
	Finalize the construction of the graph before using	33
2.3.10	$\operatorname{int}$	
	HYPRE_SStructGraphSetObjectType (HYPRE_SStructGraph graph,	
	int type)	
	Set the storage type of the associated matrix object	33

 $typedef\ struct\ hypre\_SStructGraph\_struct\ *HYPRE\_SStructGraph$ 

The graph object is used to describe the nonzero structure of a matrix

2.3.2

HYPRE\_SStructGraphCreate (MPI\_Comm comm, HYPRE\_SStructGrid grid, HYPRE\_SStructGraph\* graph)

Create a graph object

 $\_$  2.3.3  $\_$ 

int HYPRE\_SStructGraphDestroy (HYPRE\_SStructGraph graph)

Destroy a graph object

int
HYPRE\_SStructGraphSetDomainGrid (HYPRE\_SStructGraph graph,
HYPRE\_SStructGrid domain\_grid)

Set the domain grid

2.3.5

int

**HYPRE\_SStructGraphSetStencil** (HYPRE\_SStructGraph graph, int part, int var, HYPRE\_SStructStencil stencil)

Set the stencil for a variable on a structured part of the grid

\_ 2.3.6 \_

int HYPRE\_SStructGraphSetFEM (HYPRE\_SStructGraph graph, int part)

Indicate that an FEM approach will be used to set matrix values on this part

2.3.7

HYPRE\_SStructGraphSetFEMSparsity (HYPRE\_SStructGraph graph, int part, int nsparse, int\* sparsity)

Set the finite element stiffness matrix sparsity. This overrides the default full sparsity pattern described below.

Array sparsity contains nsparse row/column tuples (I,J) that indicate the nonzeroes of the local stiffness matrix. The layout of the values passed into the routine HYPRE\_SStructMatrixAddFEMValues is determined here.

The default sparsity is full (each variable is coupled to all others), and the values passed into the routine HYPRE\_SStructMatrixAddFEMValues are assumed to be by rows (that is, column indices vary fastest).

2.3.8

int
HYPRE\_SStructGraphAddEntries (HYPRE\_SStructGraph graph, int part, int\* index, int var, int to\_part, int\* to\_index, int to\_var)

Add a non-stencil graph entry at a particular index. This graph entry is appended to the existing graph entries, and is referenced as such.

NOTE: Users are required to set graph entries on all processes that own the associated variables. This means that some data will be multiply defined.

 $\_$  2.3.9  $\_$ 

int HYPRE\_SStructGraphAssemble (HYPRE\_SStructGraph graph)

Finalize the construction of the graph before using

2.3.10

mt HYPRE\_SStructGraphSetObjectType (HYPRE\_SStructGraph graph, int type)

Set the storage type of the associated matrix object. It is used before AddEntries and Assemble to compute the right ranks in the graph.

NOTE: This routine is only necessary for implementation reasons, and will eventually be removed.

HYPRE\_SStructMatrixCreate (MPI\_Comm comm, HYPRE\_SStructGraph
graph, HYPRE\_SStructMatrix\* matrix)

Create a matrix object

 $\_$  2.4.3  $\_$ 

int HYPRE\_SStructMatrixDestroy (HYPRE\_SStructMatrix matrix)

Destroy a matrix object

\_ 2.4.4 \_

int HYPRE\_SStructMatrixInitialize (HYPRE\_SStructMatrix matrix)

Prepare a matrix object for setting coefficient values

#### 2.4.5

int
HYPRE\_SStructMatrixSetValues (HYPRE\_SStructMatrix matrix, int part, int\* index, int var, int nentries, int\* entries, HYPRE\_Complex\* values)

Set matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_SStructMatrixSetBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

### 2.4.6

HYPRE\_SStructMatrixAddToValues (HYPRE\_SStructMatrix matrix, int part, int\* index, int var, int nentries, int\* entries, HYPRE\_Complex\* values)

Add to matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_SStructMatrixAddToBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type.

## 2.4.7

int
HYPRE\_SStructMatrixAddFEMValues (HYPRE\_SStructMatrix matrix, int
part, int\* index, HYPRE\_Complex\* values)

Add finite element stiffness matrix coefficients index by index. The layout of the data in values is determined by the routines HYPRE\_SStructGridSetFEMOrdering and HYPRE\_SStructGraphSetFEMSparsity ( $\rightarrow 2.3.6$ , page 32).

#### 2.4.8

int

**HYPRE\_SStructMatrixGetValues** (HYPRE\_SStructMatrix matrix, int part, int\* index, int var, int nentries, int\* entries, HYPRE\_Complex\* values)

Get matrix coefficients index by index. The values array is of length nentries.

NOTE: For better efficiency, use HYPRE\_SStructMatrixGetBoxValues to get coefficients a box at a time.

NOTE: Users may get values on any process that owns the associated variables.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

#### 2.4.9

HYPRE\_SStructMatrixGetFEMValues (HYPRE\_SStructMatrix matrix, int part, int\* index, HYPRE\_Complex\* values)

Get finite element stiffness matrix coefficients index by index. The layout of the data in values is determined by the routines HYPRE\_SStructGridSetFEMOrdering and HYPRE\_SStructGraphSetFEMSparsity ( $\rightarrow 2.3.6$ , page 32).

## 2.4.10

HYPRE\_SStructMatrixSetBoxValues (HYPRE\_SStructMatrix matrix, int part, int\* ilower, int\* iupper, int var, int nentries, HYPRE\_Inte entiies HYRRE\_oompeex vvalees)

Set matrix coefficients a box at a time. The data in values is ordered as follows:

```
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
  for (j = ilower[1]; j <= iupper[1]; j++)
    for (i = ilower[0]; i <= iupper[0]; i++)
    for (entry = 0; entry < nentries; entry++)</pre>
```

```
{
   values[m] = ...;
   m++;
}
```

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of the same type: either stencil or non-stencil, but not both. Also, if they are stencil entries, they must all represent couplings to the same variable type (there are no such restrictions for non-stencil entries).

#### 2.4.11

int

HYPRE\_SStructMatrixAddToBoxValues (HYPRE\_SStructMatrix matrix, int part, int\* ilower, int\* iupper, int var, int nentries, int\* entries, HYPRE\_Complex\* values)

Add to matrix coefficients a box at a time. The data in values is ordered as in HYPRE\_SStructMatrixSetBoxValues.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

NOTE: The entries in this routine must all be of stencil type. Also, they must all represent couplings to the same variable type.

## 2.4.12

int

HYPRE\_SStructMatrixGetBoxValues (HYPRE\_SStructMatrix matrix, int part, int\* ilower, int\* iupper, int var, int nentries, int\* entries, HYPRE\_Complex\* values)

Get matrix coefficients a box at a time. The data in values is ordered as in HYPRE\_SStructMatrixSetBoxValues.

NOTE: Users may get values on any process that owns the associated variables.

NOTE: The entries in this routine must all be of stencil type. Also, they must all represent couplings to the same variable type.

2.4.13

int HYPRE\_SStructMatrixAssemble (HYPRE\_SStructMatrix matrix)

Finalize the construction of the matrix before using

\_ 2.4.14 \_

int

**HYPRE\_SStructMatrixSetSymmetric** (HYPRE\_SStructMatrix matrix, int part, int var, int to\_var, int symmetric)

Define symmetry properties for the stencil entries in the matrix. The boolean argument symmetric is applied to stencil entries on part part that couple variable var to variable to\_var. A value of -1 may be used for part, var, or to\_var to specify "all". For example, if part and to\_var are set to -1, then the boolean is applied to stencil entries on all parts that couple variable var to all other variables.

By default, matrices are assumed to be nonsymmetric. Significant storage savings can be made if the matrix is symmetric.

2.4.15

HYPRE\_SStructMatrixSetNSSymmetric (HYPRE\_SStructMatrix matrix, int symmetric)

Define symmetry properties for all non-stencil matrix entries

\_ 2.4.16 \_\_\_

HYPRE\_SStructMatrixSetObjectType (HYPRE\_SStructMatrix matrix, int type)

Set the storage type of the matrix object to be constructed. Currently, type can be either HYPRE\_SSTRUCT (the default), HYPRE\_STRUCT, or HYPRE\_PARCSR.

See Also:

HYPRE\_SStructMatrixGetObject ( $\rightarrow$ 2.4.17, page 41)

2.4.17

HYPRE\_SStructMatrixGetObject (HYPRE\_SStructMatrix matrix, void\*\* object)

Get a reference to the constructed matrix object.

See Also:

HYPRE\_SStructMatrixSetObjectType ( $\rightarrow$ 2.4.16, page 40)

2.4.18

HYPRE\_SStructMatrixPrint (const char\* filename, HYPRE\_SStructMatrix matrix, int all)

Print the matrix to file. This is mainly for debugging purposes.

2.5.1

 $typedef \ struct \ hypre\_SStructVector\_struct \ *HYPRE\_SStructVector$ 

The vector object

2.5.2

int

HYPRE\_SStructVectorCreate (MPI\_Comm comm, HYPRE\_SStructGrid grid, HYPRE\_SStructVector\* vector)

Create a vector object

 $\_$  2.5.3  $\_$ 

int HYPRE\_SStructVectorDestroy (HYPRE\_SStructVector vector)

Destroy a vector object

254

int HYPRE\_SStructVectorInitialize (HYPRE\_SStructVector vector)

Prepare a vector object for setting coefficient values

2.5.5

int

**HYPRE\_SStructVectorSetValues** (HYPRE\_SStructVector vector, int part, int\* index, int var, HYPRE\_Complex\* value)

Set vector coefficients index by index.

NOTE: For better efficiency, use HYPRE\_SStructVectorSetBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

2.5.6

int

**HYPRE\_SStructVectorAddToValues** (HYPRE\_SStructVector vector, int part, int\* index, int var, HYPRE\_Complex\* value)

Add to vector coefficients index by index.

NOTE: For better efficiency, use HYPRE\_SStructVectorAddToBoxValues to set coefficients a box at a time.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

 $\_$  2.5.7  $\_$ 

int

**HYPRE\_SStructVectorAddFEMValues** (HYPRE\_SStructVector vector, int part, int\* index, HYPRE\_Complex\* values)

Add finite element vector coefficients index by index. The layout of the data in values is determined by the routine HYPRE\_SStructGridSetFEMOrdering.

2.5.8

int

**HYPRE\_SStructVectorGetValues** (HYPRE\_SStructVector vector, int part, int\* index, int var, HYPRE\_Complex\* value)

Get vector coefficients index by index. Users must first call the routine HYPRE\_SStructVectorGather to ensure that data owned by multiple processes is correct.

NOTE: For better efficiency, use HYPRE\_SStructVectorGetBoxValues to get coefficients a box at a time.

NOTE: Users may only get values on processes that own the associated variables.

\_ 2.5.9 \_

int

HYPRE\_SStructVectorGetFEMValues (HYPRE\_SStructVector vector, int part, int\* index, HYPRE\_Complex\* values)

Get finite element vector coefficients index by index. The layout of the data in values is determined by the routine HYPRE\_SStructGridSetFEMOrdering. Users must first call the routine HYPRE\_SStructVectorGather to ensure that data owned by multiple processes is correct.

 $\_$  2.5.10  $\_$ 

int

**HYPRE\_SStructVectorSetBoxValues** (HYPRE\_SStructVector vector, int part, int\* ilower, int\* iupper, int var, HYPRE\_Complex\* values)

Set vector coefficients a box at a time. The data in values is ordered as follows:

```
m = 0;
for (k = ilower[2]; k <= iupper[2]; k++)
    for (j = ilower[1]; j <= iupper[1]; j++)
        for (i = ilower[0]; i <= iupper[0]; i++)</pre>
```

```
{
   values[m] = ...;
   m++;
}
```

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

#### 2.5.11

int

HYPRE\_SStructVectorAddToBoxValues (HYPRE\_SStructVector vector, int part, int\* ilower, int\* iupper, int var, HYPRE\_Complex\* values)

Add to vector coefficients a box at a time. The data in values is ordered as in HYPRE\_SStructVectorSetBoxValues.

NOTE: Users are required to set values on all processes that own the associated variables. This means that some data will be multiply defined.

## \_ 2.5.12 \_

int

**HYPRE\_SStructVectorGetBoxValues** (HYPRE\_SStructVector vector, int part, int\* ilower, int\* iupper, int var, HYPRE\_Complex\* values)

Get vector coefficients a box at a time. The data in values is ordered as in HYPRE\_SStructVectorSetBoxValues. Users must first call the routine HYPRE\_SStructVectorGather to ensure that data owned by multiple processes is correct.

NOTE: Users may only get values on processes that own the associated variables.

## 2.5.13

int HYPRE\_SStructVectorAssemble (HYPRE\_SStructVector vector)

Finalize the construction of the vector before using

2.5.14

int HYPRE\_SStructVectorGather (HYPRE\_SStructVector vector)

Gather vector data so that efficient GetValues can be done. This routine must be called prior to calling GetValues to ensure that correct and consistent values are returned, especially for non cell-centered data that is shared between more than one processor.

\_\_ 2.5.15 \_\_\_\_\_

int **HYPRE\_SStructVectorSetObjectType** (HYPRE\_SStructVector vector, int type)

Set the storage type of the vector object to be constructed. Currently, type can be either HYPRE\_SSTRUCT (the default), HYPRE\_STRUCT, or HYPRE\_PARCSR.

See Also:

HYPRE\_SStructVectorGetObject ( $\rightarrow 2.5.16$ , page 47)

2.5.16

HYPRE\_SStructVectorGetObject (HYPRE\_SStructVector vector, void\*\* object)

Get a reference to the constructed vector object.

See Also:

HYPRE\_SStructVectorSetObjectType ( $\rightarrow 2.5.15$ , page 47)

\_ 2.5.17 \_\_

HYPRE\_SStructVectorPrint (const char\* filename, HYPRE\_SStructVector vector, int all)

Print the vector to file. This is mainly for debugging purposes.

3

# IJ System Interface

Names		
3.1	IJ Matrices	
		48
3.2	IJ Vectors	
		56

This interface represents a linear-algebraic conceptual view of a linear system. The 'I' and 'J' in the name are meant to be mnemonic for the traditional matrix notation A(I,J).

3.1

# IJ Matrices

Names

3.1.14	$\operatorname{int}$	
	HYPRE_IJMatrixSetRowSizes (HYPRE_IJMatrix matrix, const int* sizes)	
	(Optional) Set the max number of nonzeros to expect in each row	54
3.1.15	$\operatorname{int}$	
	HYPRE_IJMatrixSetDiagOffdSizes (HYPRE_IJMatrix matrix,	
	const int* diag_sizes,	
	const int* offdiag_sizes)	
	(Optional) Sets the exact number of nonzeros in each row of the diagonal	
	and off-diagonal blocks.	54
3.1.16	$\operatorname{int}$	
	HYPRE_IJMatrixSetMaxOffProcElmts (HYPRE_IJMatrix matrix,	
	$int max\_off\_proc\_elmts)$	
	(Optional) Sets the maximum number of elements that are expected to be set	
	(or added) on other processors from this processor This routine can signifi-	
	cantly improve the efficiency of matrix construction, and should always be	
	utilized if possible.	54
3.1.17	$\operatorname{int}$	
	HYPRE_IJMatrixSetPrintLevel (HYPRE_IJMatrix matrix, int print_level)	
	(Optional) Sets the print level, if the user wants to print error messages.	55
3.1.18	$\operatorname{int}$	

	HYPRE_IJMatrixSetOMPFlag (HYPRE_IJMatrix matrix, int omp_flag)  (Optional) if set, will use a threaded version of HYPRE_IJMatrixSetValues  and HYPRE_IJMatrixAddToValues.	55
3.1.19	$\operatorname{int}$	
	HYPRE_IJMatrixRead (const char* filename, MPI_Comm comm, int type,	
	HYPRE_IJMatrix* matrix)	
	Read the matrix from file.	55
3.1.20	$\operatorname{int}$	
	HYPRE_IJMatrixPrint (HYPRE_IJMatrix matrix, const char* filename)	
	Print the matrix to file.	55

3.1.1

typedef struct hypre\_IJMatrix\_struct \*HYPRE\_IJMatrix

The matrix object

## 3.1.2

int

**HYPRE\_IJMatrixCreate** (MPI\_Comm comm, int ilower, int iupper, int jlower, int jupper, HYPRE\_IJMatrix\* matrix)

Create a matrix object. Each process owns some unique consecutive range of rows, indicated by the global row indices ilower and iupper. The row data is required to be such that the value of ilower on any process p be exactly one more than the value of iupper on process p-1. Note that the first row of the global matrix may start with any integer value. In particular, one may use zero- or one-based indexing.

For square matrices, jlower and jupper typically should match ilower and iupper, respectively. For rectangular matrices, jlower and jupper should define a partitioning of the columns. This partitioning must be used for any vector v that will be used in matrix-vector products with the rectangular matrix. The matrix data structure may use jlower and jupper to store the diagonal blocks (rectangular in general) of the matrix separately from the rest of the matrix.

Collective.

#### 3.1.3

## int HYPRE\_IJMatrixDestroy (HYPRE\_IJMatrix matrix)

Destroy a matrix object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

#### 3.1.4

# int HYPRE\_IJMatrixInitialize (HYPRE\_IJMatrix matrix)

Prepare a matrix object for setting coefficient values. This routine will also re-initialize an already assembled matrix, allowing users to modify coefficient values.

#### 3.1.5

HYPRE\_IJMatrixSetValues (HYPRE\_IJMatrix matrix, int nrows, int\* ncols, const int\* rows, const int\* cols, const HYPRE\_Complex\* values)

Sets values for nrows rows or partial rows of the matrix. The arrays ncols and rows are of dimension nrows and contain the number of columns in each row and the row indices, respectively. The array cols contains the column indices for each of the rows, and is ordered by rows. The data in the values array corresponds directly to the column entries in cols. Erases any previous values at the specified locations and replaces them with new ones, or, if there was no value there before, inserts a new one if set locally. Note that it is not possible to set values on other processors. If one tries to set a value from proc i on proc j, proc i will erase all previous occurrences of this value in its stack (including values generated with AddToValues), and treat it like a zero value. The actual value needs to be set on proc j.

Note that a threaded version (threaded over the number of rows) will be called if  $HYPRE\_IJMatrixSetOMPFlag$  is set to a value !=0. This requires that rows[i] != rows[j] for i!=j and is only efficient if a large number of rows is set in one call to  $HYPRE\_IJMatrixSetValues$ .

Not collective.

#### 3.1.6

int

**HYPRE\_IJMatrixAddToValues** (HYPRE\_IJMatrix matrix, int nrows, int\* ncols, const int\* rows, const int\* cols, const HYPRE\_Complex\* values)

Adds to values for nrows rows or partial rows of the matrix. Usage details are analogous to HYPRE\_IJMatrixSetValues. Adds to any previous values at the specified locations, or, if there was no value there before, inserts a new one. AddToValues can be used to add to values on other processors.

Note that a threaded version (threaded over the number of rows) will be called if HYPRE\_IJMatrixSetOMPFlag is set to a value != 0. This requires that rows[i] != rows[j] for i!= j and is only efficient if a large number of rows is added in one call to HYPRE\_IJMatrixAddToValues.

Not collective.

## \_ 3.1.7 \_

int **HYPRE\_IJMatrixAssemble** (HYPRE\_IJMatrix matrix)

Finalize the construction of the matrix before using

## \_ 3.1.8 \_

int

**HYPRE\_IJMatrixGetRowCounts** (HYPRE\_IJMatrix matrix, int nrows, int\* rows, int\* ncols)

Gets number of nonzeros elements for nrows rows specified in rows and returns them in ncols, which needs to be allocated by the user

## \_\_ 3.1.9 \_\_\_\_

int

**HYPRE\_IJMatrixGetValues** (HYPRE\_IJMatrix matrix, int nrows, int\* ncols, int\* rows, int\* cols, HYPRE\_Complex\* values)

Gets values for nrows rows or partial rows of the matrix. Usage details are analogous to HYPRE\_IJMatrixSetValues.

\_\_ 3.1.10 \_\_\_

int HYPRE\_IJMatrixSetObjectType (HYPRE\_IJMatrix matrix, int type)

Set the storage type of the matrix object to be constructed. Currently, type can only be HYPRE\_PARCSR.

Not collective, but must be the same on all processes.

See Also:

<code>HYPRE\_IJMatrixGetObject</code> (  $\rightarrow 3.1.13, \; page \; 53)$ 

\_ 3.1.11 \_\_\_\_

int **HYPRE\_IJMatrixGetObjectType** (HYPRE\_IJMatrix matrix, int\* type)

Get the storage type of the constructed matrix object

\_ 3.1.12 \_

HYPRE\_IJMatrixGetLocalRange (HYPRE\_IJMatrix matrix, int\* ilower, int\* iupper, int\* jlower, int\* jupper)

Gets range of rows owned by this processor and range of column partitioning for this processor

\_ 3.1.13 \_

int HYPRE\_IJMatrixGetObject (HYPRE\_IJMatrix matrix, void\*\* object)

Get a reference to the constructed matrix object.

See Also:

HYPRE\_IJMatrixSetObjectType ( $\rightarrow 3.1.10$ , page 53)

3.1.14

int HYPRE\_IJMatrixSetRowSizes (HYPRE\_IJMatrix matrix, const int\* sizes)

(Optional) Set the max number of nonzeros to expect in each row. The array sizes contains estimated sizes for each row on this process. This call can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

3.1.15

HYPRE\_IJMatrixSetDiagOffdSizes (HYPRE\_IJMatrix matrix, const int\* diag\_sizes, const int\* offdiag\_sizes)

(Optional) Sets the exact number of nonzeros in each row of the diagonal and off-diagonal blocks. The diagonal block is the submatrix whose column numbers correspond to rows owned by this process, and the off-diagonal block is everything else. The arrays diag\_sizes and offdiag\_sizes contain estimated sizes for each row of the diagonal and off-diagonal blocks, respectively. This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

3.1.16

int

 $\label{eq:hypre_interpolation} \textbf{HYPRE\_IJMatrix SetMaxOffProcElmts} \ ( \textbf{HYPRE\_IJMatrix matrix}, \ \textbf{int} \\ \text{max\_off\_proc\_elmts} )$ 

(Optional) Sets the maximum number of elements that are expected to be set (or added) on other processors from this processor This routine can significantly improve the efficiency of matrix construction, and should always be utilized if possible.

Not collective.

3 1 17

int HYPRE\_IJMatrixSetPrintLevel (HYPRE\_IJMatrix matrix, int print\_level)

(Optional) Sets the print level, if the user wants to print error messages. The default is 0, i.e. no error messages are printed.

3.1.18

int HYPRE\_IJMatrixSetOMPFlag (HYPRE\_IJMatrix matrix, int omp\_flag)

(Optional) if set, will use a threaded version of HYPRE\_IJMatrixSetValues and HYPRE\_IJMatrixAddToValues. This is only useful if a large number of rows is set or added to at once.

NOTE that the values in the rows array of HYPRE\_IJMatrixSetValues or HYPRE\_IJMatrixAddToValues must be different from each other !!!

This option is VERY inefficient if only a small number of rows is set or added at once and/or if reallocation of storage is required and/or if values are added to off processor values.

3.1.19

HYPRE\_IJMatrixRead (const char\* filename, MPI\_Comm comm, int type, HYPRE\_IJMatrix\* matrix)

Read the matrix from file. This is mainly for debugging purposes.

\_ 3.1.20 \_\_

int **HYPRE\_IJMatrixPrint** (HYPRE\_IJMatrix matrix, const char\* filename)

Print the matrix to file. This is mainly for debugging purposes.

\_ 3.2 \_

PFMG is a semicoarsening multigrid solver that uses pointwise relaxation. For periodic problems, users should try to set the grid size in periodic dimensions to be as close to a power-of-two as possible. That is, if the grid size in a periodic dimension is given by  $N = 2^m * M$  where M is not a power-of-two, then M should be as small as possible. Large values of M will generally result in slower convergence rates.

 $\_$  4.3.1  $\_$ 

HYPRE\_StructPFMGCreate (MPI\_Comm comm, HYPRE\_StructSolver\* solver)

Create a solver object

 $_{-}$  4.3.2  $_{-}$

Destroy a solver object

\_\_\_ 4.3.3 \_\_\_\_\_

int

**HYPRE\_StructPFMGSetup** (HYPRE\_StructSolver solver, HYPRE\_StructMatrix A, HYPRE\_StructVector b, HYPRE\_StructVector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

\_ 4.3.4 \_\_\_

int

**HYPRE\_StructPFMGSolve** (HYPRE\_StructSolver solver, HYPRE\_StructMatrix A, HYPRE\_StructVector b, HYPRE\_StructVector x)

Solve the system

4.3.5

int

HYPRE\_StructPFMGSetTol (HYPRE\_StructSolver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

\_ 4.3.6 \_\_\_\_\_

ınt

HYPRE\_StructPFMGSetMaxIter (HYPRE\_StructSolver solver, int max\_iter)

(Optional) Set maximum number of iterations

137

int **HYPRE\_StructPFMGSetMaxLevels** (HYPRE\_StructSolver solver, int max\_levels)

(Optional) Set maximum number of multigrid grid levels

\_\_\_ 4.3.8 \_\_\_\_\_

HYPRE\_StructPFMGSetRelChange (HYPRE\_StructSolver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

\_\_ 4.3.9 \_\_\_\_\_

int HYPRE\_StructPFMGSetZeroGuess (HYPRE\_StructSolver solver)

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

4.3.10

int HYPRE\_StructPFMGSetNonZeroGuess (HYPRE\_StructSolver solver)

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using SetZeroGuess.

4.3.11

HYPRE\_StructPFMGSetRelaxType (HYPRE\_StructSolver solver, int relax\_type)

(Optional) Set relaxation type.

Current relaxation methods set by relax\_type are:

- 0 & Jacobi
- 1 & Weighted Jacobi (default)
- $2~\&~{\rm Red/Black}$  Gauss-Seidel (symmetric: RB pre-relaxation, BR post-relaxation) -
- 3 & Red/Black Gauss-Seidel (nonsymmetric: RB pre- and post-relaxation)

\_ 4.3.12 \_\_

HYPRE\_StructPFMGSetRAPType (HYPRE\_StructSolver solver, int rap\_type)

(Optional) Set type of coarse-grid operator to use.

Current operators set by rap\_type are:

- 0 Galerkin (default)
- 1 non-Galerkin 5-pt or 7-pt stencils

Both operators are constructed algebraically. The non-Galerkin option maintains a 5-pt stencil in 2D and a 7-pt stencil in 3D on all grid levels. The stencil coefficients are computed by averaging techniques.

4.3.13

HYPRE\_StructPFMGSetNumPreRelax (HYPRE\_StructSolver solver, int num\_pre\_relax)

(Optional) Set number of relaxation sweeps before coarse-grid correction

int HYPRE\_StructPFMGSetNumPostRelax (HYPRE\_StructSolver solver, int num\_post\_relax)

(Optional) Set number of relaxation sweeps after coarse-grid correction

HYPRE\_StructPFMGSetSkipRelax (HYPRE\_StructSolver solver, int skip\_relax)

(Optional) Skip relaxation on certain grids for isotropic problems. This can greatly improve efficiency by eliminating unnecessary relaxations when the underlying problem is isotropic.

\_\_\_ 4.3.16 \_\_\_\_\_

int HYPRE\_StructPFMGSetLogging (HYPRE\_StructSolver solver, int logging)

(Optional) Set the amount of logging to do

HYPRE\_StructPFMGSetPrintLevel (HYPRE\_StructSolver solver, int print\_level)

(Optional) Set the amount of printing to do to the screen

#### 4.3.18

## \_ 4.11.1 \_

 $\begin{array}{l} \text{int} \\ \textbf{HYPRE\_StructHybridCreate} \text{ (MPI\_Comm comm, HYPRE\_StructSolver*} \\ \text{solver)} \end{array}$ 

Create a solver object

int HYPRE\_StructHybridDestroy (HYPRE\_StructSolver solver)

Destroy a solver object

\_\_ 4.11.3 \_\_\_\_\_

int

**HYPRE\_StructHybridSetup** (HYPRE\_StructSolver solver, HYPRE\_StructMatrix A, HYPRE\_StructVector b, HYPRE\_StructVector x)

Prepare to solve the system. The coefficient data in  ${\tt b}$  and  ${\tt x}$  is ignored here, but information about the layout of the data may be used.

\_ 4.11.4 \_\_\_\_\_

int **HYPRE\_StructHybridSolve** (HYPRE\_StructSolver solver,
HYPRE\_StructMatrix A, HYPRE\_StructVector b, HYPRE\_StructVector x)

Solve the system

4.11.5

int

HYPRE\_StructHybridSetTol (HYPRE\_StructSolver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

HYPRE\_StructHybridSetConvergenceTol (HYPRE\_StructSolver solver, HYPRE\_Real cf\_tol)

(Optional) Set an accepted convergence tolerance for diagonal scaling (DS). The solver will switch preconditioners if the convergence of DS is slower than cf\_tol.

#### 4.11.7

int

 $\label{lem:hypre_struct} \begin{tabular}{ll} HYPRE\_StructSolver solver, int ds\_max\_its) \end{tabular}$ 

(Optional) Set maximum number of iterations for diagonal scaling (DS). The solver will switch preconditioners if DS reaches ds\_max\_its.

#### 4.11.8

int

HYPRE\_StructHybridSetPCGMaxIter (HYPRE\_StructSolver solver, int pre\_max\_its)

(Optional) Set maximum number of iterations for general preconditioner (PRE). The solver will stop if PRE reaches pre\_max\_its.

#### 4.11.9

int

**HYPRE\_StructHybridSetTwoNorm** (HYPRE\_StructSolver solver, int two\_norm)

(Optional) Use the two-norm in stopping criteria

int

 $\label{lem:hyprid} \textbf{HYPRE\_StructHybridSetRelChange} \ (\textbf{HYPRE\_StructSolver solver}, \ \textbf{int rel\_change})$ 

(Optional) Additionally require that the relative difference in successive iterates be small

4.11.11

HYPRE\_StructHybridSetSolverType (HYPRE\_StructSolver solver, int solver\_type)

(Optional) Set the type of Krylov solver to use.

Current krylov methods set by solver\_type are:

- 0 PCG (default)
- 1 GMRES
- 2 BiCGSTAB

\_\_ 4.11.12 \_\_\_\_

int HYPRE\_StructHybridSetKDim (HYPRE\_StructSolver solver, int k\_dim)

(Optional) Set the maximum size of the Krylov space when using GMRES

\_ 4.11.13 \_\_\_\_\_

int

**HYPRE\_StructHybridSetPrecond** (HYPRE\_StructSolver solver, HYPRE\_PtrToStructSolverFcn precond, HYPRE\_PtrToStructSolverFcn precond\_solver)

(Optional) Set the preconditioner to use

4 11 14

int HYPRE\_StructHybridSetLogging (HYPRE\_StructSolver solver, int logging)

(Optional) Set the amount of logging to do

\_\_ 4.11.15 \_\_\_\_\_

HYPRE\_StructHybridSetPrintLevel (HYPRE\_StructSolver solver, int print\_level)

(Optional) Set the amount of printing to do to the screen

\_ 4.11.16 \_\_

int

**HYPRE\_StructHybridGetNumIterations** (HYPRE\_StructSolver solver, int\* num\_its)

Return the number of iterations taken

4.11.17

HYPRE\_StructHybridGetDSCGNumIterations (HYPRE\_StructSolver solver, int\* ds\_num\_its)

Return the number of diagonal scaling iterations taken

HYPRE\_StructHybridGetPCGNumIterations (HYPRE\_StructSolver solver, int\* pre\_num\_its)

Return the number of general preconditioning iterations taken

#### \_ 4.11.19 \_\_\_\_\_

int

## $HYPRE\_StructHybridGetFinalRelativeResidualNorm$

(HYPRE\_StructSolver solver, HYPRE\_Real\* norm)

Return the norm of the final relative residual

4.12

## Struct LOBPCG Eigensolver

### Names

4.12.1 int

HYPRE\_StructSetupInterpreter (mv\_InterfaceInterpreter\* i)

Load interface interpreter. 92

4.12.2 int

HYPRE\_StructSetupMatvec (HYPRE\_MatvecFunctions\* mv)

Load Matvec interpreter with hypre\_StructKrylov functions 93

These routines should be used in conjunction with the generic interface in LOBPCG Eigensolver.

 $\_$  4.12.1  $\_$ 

int HYPRE\_StructSetupInterpreter (mv\_InterfaceInterpreter\* i)

 $Load\ interface\ interpreter.\ Vector\ part\ loaded\ with\ hypre\_StructKrylov\ functions\ and\ multivector\ part\ loaded\ with\ mv\_TempMultiVector\ functions.$ 

4.12.2

 $int \ \mathbf{HYPRE\_StructSetupMatvec} \ (HYPRE\_MatvecFunctions*\ mv)$

SysPFMG is a semicoarsening multigrid solver similar to PFMG, but for systems of PDEs. For periodic problems, users should try to set the grid size in periodic dimensions to be as close to a power-of-two as possible (for more details, see Struct PFMG Solver).

HYPRE\_SStructSysPFMGCreate (MPI\_Comm comm, HYPRE\_SStructSolver\* solver)

Create a solver object

\_\_ 5.2.2 \_

int HYPRE\_SStructSysPFMGDestroy (HYPRE\_SStructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

\_\_ 5.2.3 \_\_\_\_

HYPRE\_SStructSysPFMGSetup (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

\_ 5.2.4 \_

int

HYPRE\_SStructSysPFMGSolve (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Solve the system

HYPRE\_SStructSysPFMGSetTol (HYPRE\_SStructSolver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

5.2.6

HYPRE\_SStructSysPFMGSetMaxIter (HYPRE\_SStructSolver solver, int max\_iter)

(Optional) Set maximum number of iterations

\_\_ 5.2.7 \_\_\_\_\_

int **HYPRE\_SStructSysPFMGSetRelChange** (HYPRE\_SStructSolver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

\_\_ 5.2.8 \_\_\_\_\_

int HYPRE\_SStructSysPFMGSetZeroGuess (HYPRE\_SStructSolver solver)

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

int

HYPRE\_SStructSysPFMGSetNonZeroGuess (HYPRE\_SStructSolver solver)

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using SetZeroGuess.

\_ 5.2.10 \_\_

int

**HYPRE\_SStructSysPFMGSetRelaxType** (HYPRE\_SStructSolver solver, int relax\_type)

(Optional) Set relaxation type.

Current relaxation methods set by relax\_type are:

- 0 Jacobi
- 1 Weighted Jacobi (default)
- 2 Red/Black Gauss-Seidel (symmetric: RB pre-relaxation, BR post-relaxation)

\_\_ 5.2.11 \_\_\_\_\_

int

 $\label{lem:hypre_structSysPFMGSetJacobiWeight} \begin{tabular}{l} HYPRE\_SStructSolver solver, \\ HYPRE\_Real weight) \end{tabular}$ 

(Optional) Set Jacobi Weight

5.2.12

int

**HYPRE\_SStructSysPFMGSetNumPreRelax** (HYPRE\_SStructSolver solver, int num\_pre\_relax)

(Optional) Set number of relaxation sweeps before coarse-grid correction

int HYPRE\_SStructSysPFMGSetNumPostRelax (HYPRE\_SStructSolver solver, int num\_post\_relax)

(Optional) Set number of relaxation sweeps after coarse-grid correction

5.2.14

int

 $\label{eq:hypre_structSysPFMGSetSkipRelax} \mbox{(HYPRE\_SStructSolver solver, int skip\_relax)}$ 

(Optional) Skip relaxation on certain grids for isotropic problems. This can greatly improve efficiency by eliminating unnecessary relaxations when the underlying problem is isotropic.

\_\_\_ 5.2.15 \_\_\_\_\_

int

 $\label{eq:hypre_structSysPFMGSetLogging} \ (\mbox{HYPRE\_SStructSolver solver}, \mbox{ int logging})$ 

(Optional) Set the amount of logging to do

\_ 5.2.16 \_\_

ınt

HYPRE\_SStructSysPFMGSetPrintLevel (HYPRE\_SStructSolver solver, int print\_level)

(Optional) Set the amount of printing to do to the screen

HYPRE\_SStructSysPFMGGetNumIterations (HYPRE\_SStructSolver solver, int\* num\_iterations)

Return the number of iterations taken

5.2.18

int

# $HYPRE\_SStructSysPFMGGetFinalRelativeResidualNorm$

(HYPRE\_SStructSolver solver, HYPRE\_Real\* norm)

Return the norm of the final relative residual

	HYPRE_SStructFACSetNumPreRelax (HYPRE_SStructSolver solver, int num_pre_relax)	
	(Optional) Set number of relaxation sweeps before coarse-grid correction .	112
5.4.21	$\operatorname{int}$	
	HYPRE_SStructFACSetNumPostRelax (HYPRE_SStructSolver solver, int num_post_relax)	
	(Optional) Set number of relaxation sweeps after coarse-grid correction	112
5.4.22	int HYPRE_SStructFACSetCoarseSolverType (HYPRE_SStructSolver solver, int csolver_type)	
	(Optional) Set coarsest solver type.	113
5.4.23	int HYPRE_SStructFACSetLogging (HYPRE_SStructSolver solver, int logging)	
	(Optional) Set the amount of logging to do	113
5.4.24	int	
	HYPRE_SStructFACGetNumIterations (HYPRE_SStructSolver solver, int* num_iterations)	
	Return the number of iterations taken	113
5.4.25	$\operatorname{int} \\ \mathbf{HYPRE\_SStructFACGetFinalRelativeResidualNorm}$	
	(HYPRE_SStructSolver	
	solver,	
	$\mathrm{HYPRE}_{-}\mathrm{Real}^*$	
	norm)	113
	Return the norm of the final relative residual	113

 $\begin{array}{l} \operatorname{int} \\ \mathbf{HYPRE\_SStructFACCreate} \ (\operatorname{MPI\_Comm} \ \operatorname{comm}, \ \operatorname{HYPRE\_SStructSolver*} \ \operatorname{solver}) \end{array}$ 

Create a solver object

int HYPRE\_SStructFACDestroy2 (HYPRE\_SStructSolver solver)

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

5.4.3

int

HYPRE\_SStructFACAMR\_RAP (HYPRE\_SStructMatrix A, int (\*rfactors)[HYPRE\_MAXDIM], HYPRE\_SStructMatrix\* fac\_A)

Re-distribute the composite matrix so that the amr hierarchy is approximately nested. Coarse underlying operators are also formed.

5.4.4

int

HYPRE\_SStructFACSetup2 (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Set up the FAC solver structure

\_ 5.4.5 \_

inf

HYPRE\_SStructFACSolve3 (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Solve the system

HYPRE\_SStructFACSetPLevels (HYPRE\_SStructSolver solver, int nparts, int\* plevels)

Set up amr structure

5.4.7

int

 $\label{lem:hypre_struct} \textbf{HYPRE\_SStructSolver solver}, int \\ nparts, int (*rfactors)[HYPRE\_MAXDIM] )$ 

Set up amr refinement factors

\_\_ 5.4.8 \_\_\_\_\_

int
HYPRE\_SStructFACZeroCFSten (HYPRE\_SStructMatrix A,
HYPRE\_SStructGrid grid, int part, int rfactors[HYPRE\_MAXDIM])

(Optional, but user must make sure that they do this function otherwise) Zero off the coarse level stencils reaching into a fine level grid

5.4.9

HYPRE\_SStructFACZeroFCSten (HYPRE\_SStructMatrix A, HYPRE\_SStructGrid grid, int part)

(Optional, but user must make sure that they do this function otherwise) Zero off the fine level stencils reaching into a coarse level grid

int
HYPRE\_SStructFACZeroAMRMatrixData (HYPRE\_SStructMatrix A, int
part\_crse, int rfactors[HYPRE\_MAXDIM])

(Optional, but user must make sure that they do this function otherwise) Places the identity in the coarse grid matrix underlying the fine patches. Required between each pair of amr levels.

5.4.11

HYPRE\_SStructFACZeroAMRVectorData (HYPRE\_SStructVector b, int\* plevels, int (\*rfactors)[HYPRE\_MAXDIM] )

(Optional, but user must make sure that they do this function otherwise) Places zeros in the coarse grid vector underlying the fine patches. Required between each pair of amr levels.

 $\_$  5.4.12  $\_$ 

int  ${\bf HYPRE\_SStructFACSetMaxLevels}$  (  ${\bf HYPRE\_SStructSolver}$  solver, int max\_levels )

(Optional) Set maximum number of FAC levels

\_ 5.4.13 \_

HYPRE\_SStructFACSetTol (HYPRE\_SStructSolver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

int

HYPRE\_SStructFACSetMaxIter (HYPRE\_SStructSolver solver, int max\_iter)

(Optional) Set maximum number of iterations

 $\_$  5.4.15  $\_$ 

HYPRE\_SStructFACSetRelChange (HYPRE\_SStructSolver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

 $\_$  5.4.16  $\_$ 

int HYPRE\_SStructFACSetZeroGuess (HYPRE\_SStructSolver solver)

(Optional) Use a zero initial guess. This allows the solver to cut corners in the case where a zero initial guess is needed (e.g., for preconditioning) to reduce computational cost.

5.4.17

int HYPRE\_SStructFACSetNonZeroGuess (HYPRE\_SStructSolver solver)

(Optional) Use a nonzero initial guess. This is the default behavior, but this routine allows the user to switch back after using SetZeroGuess.

HYPRE\_SStructFACSetRelaxType (HYPRE\_SStructSolver solver, int relax\_type)

(Optional) Set relaxation type. See HYPRE\_SStructSysPFMGSetRelaxType for appropriate values of  $relax\_type$ .

5.4.19

HYPRE\_SStructFACSetJacobiWeight (HYPRE\_SStructSolver solver, HYPRE\_Real weight)

(Optional) Set Jacobi weight if weighted Jacobi is used

\_\_\_ 5.4.20 \_\_\_\_\_

int **HYPRE\_SStructFACSetNumPreRelax** (HYPRE\_SStructSolver solver, int num\_pre\_relax)

(Optional) Set number of relaxation sweeps before coarse-grid correction

5.4.21

int **HYPRE\_SStructFACSetNumPostRelax** (HYPRE\_SStructSolver solver, int num\_post\_relax)

(Optional) Set number of relaxation sweeps after coarse-grid correction

int

 $\label{lem:hypre_struct} \begin{tabular}{ll} HYPRE\_SStructSolver solver, int csolver\_type \\ \end{tabular}$ 

(Optional) Set coarsest solver type.

Current solver types set by csolver\_type are:

- 1 SysPFMG-PCG (default)
- 2 SysPFMG

5.4.23

int HYPRE\_SStructFACSetLogging (HYPRE\_SStructSolver solver, int logging)

(Optional) Set the amount of logging to do

 $\_$  5.4.24  $\_$ 

int

**HYPRE\_SStructFACGetNumIterations** (HYPRE\_SStructSolver solver, int\* num\_iterations)

Return the number of iterations taken

 $\_$  5.4.25  $\_\_$ 

int

 $HYPRE\_SStructFACGetFinalRelativeResidualNorm$ 

(HYPRE\_SStructSolver solver, HYPRE\_Real\* norm)

Return the norm of the final relative residual

#### $HYPRE\_SStructMaxwellGetFinalRelativeResidualNorm$

(HYPRE\_SStructSolver solver, HYPRE\_Real\* norm)

5.5.1

int **HYPRE\_SStructMaxwellCreate** ( MPI\_Comm comm, HYPRE\_SStructSolver\* solver )

Create a solver object

5.5.2

int HYPRE\_SStructMaxwellDestroy ( HYPRE\_SStructSolver solver )

Destroy a solver object. An object should be explicitly destroyed using this destructor when the user's code no longer needs direct access to it. Once destroyed, the object must not be referenced again. Note that the object may not be deallocated at the completion of this call, since there may be internal package references to the object. The object will then be destroyed when all internal reference counts go to zero.

\_ 5.5.3 \_

ınt

**HYPRE\_SStructMaxwellSetup** (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

int

**HYPRE\_SStructMaxwellSolve** (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Solve the system. Full coupling of the augmented system used throughout the multigrid hierarchy.

5.5.5

int

**HYPRE\_SStructMaxwellSolve2** (HYPRE\_SStructSolver solver, HYPRE\_SStructMatrix A, HYPRE\_SStructVector b, HYPRE\_SStructVector x)

Solve the system. Full coupling of the augmented system used only on the finest level, i.e., the node and edge multigrid cycles are coupled only on the finest level.

\_\_ 5.5.6 \_\_

int **HYPRE\_SStructMaxwellSetGrad** (HYPRE\_SStructSolver solver,
HYPRE\_ParCSRMatrix T)

Sets the gradient operator in the Maxwell solver

\_ 5.5.7 \_

int

 $\label{lem:hypre_sstructMaxwellSetRfactors} \ (\mbox{HYPRE\_SStructSolver solver, int rfactors} \ (\mbox{HYPRE\_MAXDIM}))$ 

Sets the coarsening factor

int

**HYPRE\_SStructMaxwellPhysBdy** (HYPRE\_SStructGrid\* grid\_l, int num\_levels, int rfactors[HYPRE\_MAXDIM], int\*\*\* BdryRanks\_ptr, int\*\*\* BdryRanksCnt\_ptr )

Finds the physical boundary row ranks on all levels

\_\_ 5.5.9 \_\_\_\_\_

 $\operatorname{int}$ 

**HYPRE\_SStructMaxwellEliminateRowsCols** (HYPRE\_ParCSRMatrix parA, int nrows, int\* rows )

Eliminates the rows and cols corresponding to the physical boundary in a parcsr matrix

5.5.10

int

 $\label{eq:hypre_structMaxwellZeroVector} \textbf{(HYPRE\_ParVector b, int* rows, int nrows)}$ 

Zeros the rows corresponding to the physical boundary in a par vector

\_ 5.5.11 \_

int

**HYPRE\_SStructMaxwellSetSetConstantCoef** (HYPRE\_SStructSolver solver, int flag)

(Optional) Set the constant coefficient flag- Nedelec interpolation used

int **HYPRE\_SStructMaxwellGrad** (HYPRE\_SStructGrid grid,
HYPRE\_ParCSRMatrix\* T)

(Optional) Creates a gradient matrix from the grid. This presupposes a particular orientation of the edge elements.

5.5.13

HYPRE\_SStructMaxwellSetTol (HYPRE\_SStructSolver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

\_\_\_ 5.5.14 \_\_\_\_\_

HYPRE\_SStructMaxwellSetMaxIter (HYPRE\_SStructSolver solver, int max\_iter)

(Optional) Set maximum number of iterations

5.5.15

HYPRE\_SStructMaxwellSetRelChange (HYPRE\_SStructSolver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

int

 $\label{lem:hypre_struct} \textbf{HYPRE\_SStructSolver solver}, \ int \\ num\_pre\_relax)$ 

(Optional) Set number of relaxation sweeps before coarse-grid correction

5.5.17

int

 $\label{lem:hypre_sstruct} \textbf{HYPRE\_SStructSolver solver}, \\ \textbf{int } num\_post\_relax)$ 

(Optional) Set number of relaxation sweeps after coarse-grid correction

\_\_ 5.5.18 \_\_\_\_\_

int

HYPRE\_SStructMaxwellSetLogging (HYPRE\_SStructSolver solver, int logging)

(Optional) Set the amount of logging to do

5.5.19

int

**HYPRE\_SStructMaxwellGetNumIterations** (HYPRE\_SStructSolver solver, int\* num\_iterations)

Return the number of iterations taken

#### int

## $HYPRE\_SStruct Maxwell GetFinal Relative Residual Norm$

 $({\it HYPRE\_SStructSolver solver}, \, {\it HYPRE\_Real* norm})$ 

Return the norm of the final relative residual

\_\_\_ 5.6 \_\_\_\_\_

### SStruct PCG Solver

### Names

5.6.1	int  HYPRE_SStructPCGCreate (MPI_Comm comm,  HYPRE_SStructSolver* solver)  Create a solver object	121

int min_coarse_size)  (Optional) Sets minimum size of coarsest grid
HYPRE_BoomerAMGSetMaxLevels (HYPRE_Solver solver, int max_levels)  (Optional) Sets maximum number of multigrid levels
int HYPRE_BoomerAMGSetStrongThreshold (HYPRE_Solver solver, HYPRE_Real strong_threshold)  (Optional) Sets AMG strength threshold.  (Optional) Sets AMG strength threshold.  HYPRE_BoomerAMGSetSCommPkgSwitch (HYPRE_Solver solver, HYPRE_Real S_commpkg_switch)  (Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A.  143  int HYPRE_BoomerAMGSetMaxRowSum (HYPRE_Solver solver, HYPRE_Real max_row_sum)  (Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix.  143  int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
HYPRE_BoomerAMGSetStrongThreshold (HYPRE_Solver solver, HYPRE_Real strong_threshold)  (Optional) Sets AMG strength threshold
HYPRE_Real strong_threshold)  (Optional) Sets AMG strength threshold
int  HYPRE_BoomerAMGSetSCommPkgSwitch (HYPRE_Solver solver, HYPRE_Real S_commpkg_switch)  (Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A
HYPRE_BoomerAMGSetSCommPkgSwitch (HYPRE_Solver solver, HYPRE_Real S_commpkg_switch)  (Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A
HYPRE_Real S_commpkg_switch)  (Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A
S_commpkg_switch)  (Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A
(Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A
int  HYPRE_BoomerAMGSetMaxRowSum (HYPRE_Solver solver, HYPRE_Real max_row_sum)  (Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix.  143  int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
HYPRE_BoomerAMGSetMaxRowSum (HYPRE_Solver solver, HYPRE_Real max_row_sum)  (Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix.  143  int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
HYPRE_Real max_row_sum)  (Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix
(Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix
int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
int HYPRE_BoomerAMGSetCoarsenType (HYPRE_Solver solver,
${\bf HYPRE\_BoomerAMGSetCoarsenType}~({\tt HYPRE\_Solver}~solver,$
int coarsen_type)
(Optional) Defines which parallel coarsening algorithm is used
$\operatorname{int}$
· ·
· · · · · · · · · · · · · · · · · · ·
nongalerkin_tol, int level)
(Optional) Defines the level specific non-Galerkin drop-tolerances for spar-
sifying coarse grid operators and thus reducing communication
$\operatorname{int}$
V = (
int measure_tvpe)
· · · · · · · · · · · · · · · · · · ·
(Optional) Defines whether local or global measures are used
(Optional) Defines whether local or global measures are used
(Optional) Defines whether local or global measures are used
(Optional) Defines whether local or global measures are used
int  HYPRE_BoomerAMGSetAggNumLevels (HYPRE_Solver solver, int agg_num_levels)  (Optional) Defines the number of levels of aggressive coarsening. 145
int  HYPRE_BoomerAMGSetAggNumLevels (HYPRE_Solver solver,
int  HYPRE_BoomerAMGSetAggNumLevels (HYPRE_Solver solver, int agg_num_levels)  (Optional) Defines the number of levels of aggressive coarsening. 145
int  HYPRE_BoomerAMGSetNonGalerkinTol (HYPRE_Solver solver, HYPRE_Real nongalerkin_tol)  (Optional) Defines the non-Galerkin drop-tolerance for sparsifying coarse grid operators and thus reducing communication.  int HYPRE_BoomerAMGSetLevelNonGalerkinTol (HYPRE_Solver solver, HYPRE_Real nongalerkin_tol, int level)  (Optional) Defines the level specific non-Galerkin drop-tolerances for sparsifying coarse grid operators and thus reducing communication.  14

	HYPRE_BoomerAMGSetCGCIts (HYPRE_Solver solver, int its)  (optional) Defines the number of pathes for CGC-coarsening	146
6.2.28	int  HYPRE_BoomerAMGSetNodal (HYPRE_Solver solver, int nodal)	
	(Optional) Sets whether to use the nodal systems coarsening	146
6.2.29	int  HYPRE_BoomerAMGSetNodalDiag (HYPRE_Solver solver, int nodal_diag)  (Optional) Sets whether to give special treatment to diagonal elements in the nodal systems version.	146
6.2.30	int  HYPRE_BoomerAMGSetInterpType (HYPRE_Solver solver,	
	int interp_type) (Optional) Defines which parallel interpolation operator is used	146
6.2.31	int  HYPRE_BoomerAMGSetTruncFactor (HYPRE_Solver solver,  HYPRE_Real trunc_factor)	
	(Optional) Defines a truncation factor for the interpolation	147
6.2.32	int HYPRE_BoomerAMGSetPMaxElmts (HYPRE_Solver solver, int P_max_elmts)	
	(Optional) Defines the maximal number of elements per row for the interpolation.	147
6.2.33	int  HYPRE_BoomerAMGSetSepWeight (HYPRE_Solver solver, int sep_weight)  (Optional) Defines whether separation of weights is used when defining strength for standard interpolation or multipass interpolation	147
6.2.34	int HYPRE_BoomerAMGSetAggInterpType (HYPRE_Solver solver, int agg_interp_type)	
	(Optional) Defines the interpolation used on levels of aggressive coarsening The default is 4, ie.	148
6.2.35	int HYPRE_BoomerAMGSetAggTruncFactor (HYPRE_Solver solver, HYPRE_Real agg_trunc_factor)	
	(Optional) Defines the truncation factor for the interpolation used for aggressive coarsening.	148
6.2.36	int HYPRE_BoomerAMGSetAggP12TruncFactor (HYPRE_Solver solver,	
	HYPRE_Real agg_P12_trunc_factor)	
	(Optional) Defines the truncation factor for the matrices P1 and P2 which are used to build 2-stage interpolation.	148
6.2.37	int <b>HYPRE_BoomerAMGSetAggPMaxElmts</b> (HYPRE_Solver solver, int agg_P_max_elmts)	
	(Optional) Defines the maximal number of elements per row for the interpolation used for aggressive coarsening.	149
6.2.38	$\operatorname{int}$	

	HYPRE_BoomerAMGSetAggP12MaxElmts (HYPRE_Solver solver,	
	int agg_P12_max_elmts)	
	(Optional) Defines the maximal number of elements per row for the matrices P1 and P2 which are used to build 2-stage interpolation	149
6.2.39	$\operatorname{int}$	
	HYPRE_BoomerAMGSetInterpVectors (HYPRE_Solver solver,	
	int num_vectors,	
	HYPRE_ParVector* interp_vectors	
	(Optional) Allows the user to incorporate additional vectors into the inter-	
	polation for systems AMG, eg	149
6.2.40	int	
	HYPRE_BoomerAMGSetInterpVecVariant (HYPRE_Solver solver, int var)	
	(Optional) Defines the interpolation variant	
	$used \hspace{1cm} for \hspace{1cm} HYPRE\_BoomerAMGSetInterp Vectors:$	
	1 GM approach 1	
	2 GM approach 2 (to be preferred over 1)	149
	$3 \mid LN \ approach$	
6.2.41	int	
	HYPRE_BoomerAMGSetInterpVecQMax (HYPRE_Solver solver,	
	int q_max )	
	(Optional) Defines the maximal elements per row for $Q$ , the additional columns added to the original interpolation matrix $P$ , to reduce complexity.	
	columns daded to the original interpolation matrix F, to reduce complexity.	150
		100
6.2.42	int	
	HYPRE_BoomerAMGSetInterpVecAbsQTrunc (HYPRE_Solver solver,	
	HYPRE_Real q_trunc)	
	(Optional) Defines a truncation factor for Q, the additional columns added	150
	to the original interpolation matrix $P$ , to reduce complexity	150
6.2.43	int	
	HYPRE_BoomerAMGSetGSMG (HYPRE_Solver solver, int gsmg)	
	(Optional) Specifies the use of GSMG - geometrically smooth coarsening and	
	interpolation.	150
6.2.44	$\operatorname{int}$	
	HYPRE_BoomerAMGSetNumSamples (HYPRE_Solver solver,	
	int num_samples)	
	(Optional) Defines the number of sample vectors used in GSMG or LS in-	
	terpolation	150
6.2.45	$\operatorname{int}$	
	HYPRE_BoomerAMGSetCycleType (HYPRE_Solver solver, int cycle_type)	
	(Optional) Defines the type of cycle	151
6.2.46	int	
0.4.40	HYPRE_BoomerAMGSetAdditive (HYPRE_Solver solver, int addlvl)	
	(Optional) Defines use of an additive $V(1, 1)$ -cycle using the classical addi-	
	tive method starting at level 'addlvl'.	151
C O 47		
6.2.47	int	

	<b>HYPRE_BoomerAMGSetMultAdditive</b> (HYPRE_Solver solver, int addlvl) (Optional) Defines use of an additive $V(1, 1)$ -cycle using the mult-additive method starting at level 'addlvl'.	151
6.2.48	int <b>HYPRE_BoomerAMGSetSimple</b> (HYPRE_Solver solver, int addlvl)  (Optional) Defines use of an additive V(1, 1)-cycle using the simplified mult- additive method starting at level 'addlvl'	151
6.2.49	int HYPRE_BoomerAMGSetAddLastLvl (HYPRE_Solver solver,	101
	int add_last_lvl)  (Optional) Defines last level where additive, mult-additive or simple cycle is used.	152
6.2.50	int <b>HYPRE_BoomerAMGSetMultAddTruncFactor</b> (HYPRE_Solver solver, HYPRE_Real	
	add_trunc_factor)  (Optional) Defines the truncation factor for the smoothed interpolation used for mult-additive or simple method.	152
6.2.51	$\begin{array}{ll} & \text{int} \\ & \textbf{HYPRE\_BoomerAMGSetMultAddPMaxEImts} \text{ (HYPRE\_Solver solver,} \end{array}$	102
	int add_P_max_elmts)  (Optional) Defines the maximal number of elements per row for the smoothed interpolation used for mult-additive or simple method	152
6.2.52	int HYPRE_BoomerAMGSetAddRelaxType (HYPRE_Solver solver, int add_rlx_type)	
6.2.53	(Optional) Defines the relaxation type used in the (mult)additive cycle portion (also affects simple method) The default is 18 (L1-Jacobi)	153
0.2.00	HYPRE_BoomerAMGSetAddRelaxWt (HYPRE_Solver solver, HYPRE_Real add_rlx_wt)  (Optional) Defines the relaxation weight used for Jacobi within the  (mult)additive or simple cycle portion.	153
6.2.54	int HYPRE_BoomerAMGSetSeqThreshold (HYPRE_Solver solver, int seq_threshold)	100
	(Optional) Sets maximal size for agglomeration or redundant coarse grid solve.	153
6.2.55	int  HYPRE_BoomerAMGSetRedundant (HYPRE_Solver solver, int redundant)  (Optional) operates switch for redundancy.	153
6.2.56	int HYPRE_BoomerAMGSetNumSweeps (HYPRE_Solver solver, int num_sweeps)	
a o ==	(Optional) Sets the number of sweeps.	154
6.2.57	$\operatorname{int}$	

	HYPRE_BoomerAMGSetCycleNumSweeps (HYPRE_Solver solver,
	int num_sweeps, int k)
	(Optional) Sets the number of sweeps at a specified cycle
6.2.58	int
	HYPRE_BoomerAMGSetGridRelaxType (HYPRE_Solver solver,
	int* grid_relax_type)
	(Optional) Defines which smoother is used on the fine and coarse grid, the
	up and down cycle.
6.2.59	int
	HYPRE_BoomerAMGSetRelaxType (HYPRE_Solver solver, int relax_type)
	(Optional) Defines the smoother to be used
6.2.60	int
	${\bf HYPRE\_BoomerAMGSetCycleRelaxType}~({\tt HYPRE\_Solver}~solver,$
	int relax_type, int k)
	(Optional) Defines the smoother at a given cycle
6.2.61	int
	${\bf HYPRE\_BoomerAMGSetRelaxOrder}~({\bf HYPRE\_Solver}~solver,$
	int relax_order)
	(Optional) Defines in which order the points are relaxed
6.2.62	int
	HYPRE_BoomerAMGSetRelaxWt (HYPRE_Solver solver,
	HYPRE_Real relax_weight)
	(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.
6.2.63	$\operatorname{int}$
0.2.00	HYPRE_BoomerAMGSetLevelRelaxWt (HYPRE_Solver solver,
	HYPRE_Real relax_weight,
	int level)
	(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid
	SOR on the user defined level.
6.2.64	int
	HYPRE_BoomerAMGSetOmega (HYPRE_Solver solver,
	HYPRE_Real* omega)
	(Optional) Defines the outer relaxation weight for hybrid SOR
6.2.65	int
0.2.00	HYPRE_BoomerAMGSetOuterWt (HYPRE_Solver solver,
	HYPRE_Real omega)
	(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR
	on all levels.
6.2.66	$\operatorname{int}$
2.2.00	HYPRE_BoomerAMGSetLevelOuterWt (HYPRE_Solver solver,
	HYPRE_Real omega, int level)
	(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on
	the user defined level.
6.2.67	int
0.2.01	HYPRE_BoomerAMGSetChebyOrder (HYPRE_Solver solver, int order)
	(Optional) Defines the Order for Chebyshev smoother
6.2.68	, - , , , , , , , , , , , , , , , , , ,
$0.2.0\delta$	int

	HYPRE_BoomerAMGSetChebyFraction (HYPRE_Solver solver, HYPRE_Real ratio)	
	(Optional) Fraction of the spectrum to use for the Chebyshev smoother	157
6.2.69	$\operatorname{int}$	
	HYPRE_BoomerAMGSetSmoothType (HYPRE_Solver solver, int smooth_type)	
	(Optional) Enables the use of more complex smoothers	158
6.2.70	$\operatorname{int}$	
	HYPRE_BoomerAMGSetSmoothNumLevels (HYPRE_Solver solver, int smooth_num_levels)	
	(Optional) Sets the number of levels for more complex smoothers	158
6.2.71	$\operatorname{int}$	
	HYPRE_BoomerAMGSetSmoothNumSweeps (HYPRE_Solver solver, int smooth_num_sweeps)	
	(Optional) Sets the number of sweeps for more complex smoothers	158
6.2.72	$\operatorname{int}$	
	HYPRE_BoomerAMGSetVariant (HYPRE_Solver solver, int variant)	
	(Optional) Defines which variant of the Schwarz method is used	159
6.2.73	$\operatorname{int}$	
	HYPRE_BoomerAMGSetOverlap (HYPRE_Solver solver, int overlap)	
	(Optional) Defines the overlap for the Schwarz method	159
6.2.74	$\operatorname{int}$	
	HYPRE_BoomerAMGSetDomainType (HYPRE_Solver solver,	
	int domain_type)	150
	(Optional) Defines the type of domain used for the Schwarz method	159
6.2.75	int	
	HYPRE_BoomerAMGSetSchwarzRlxWeight (HYPRE_Solver solver, HYPRE_Real	
	schwarz_rlx_weight)	
	(Optional) Defines a smoothing parameter for the additive Schwarz method	
	(Optional) Defines a smoothing parameter for the additive Schwarz method	160
6.2.76	int HYPRE_BoomerAMGSetSchwarzUseNonSymm (HYPRE_Solver solver,	
	int use_nonsymm)	
	(Optional) Indicates that the aggregates may not be SPD for the Schwarz	
	method.	160
6.2.77	$\operatorname{int}$	
V.=.,,	HYPRE_BoomerAMGSetSym (HYPRE_Solver solver, int sym)	
	(Optional) Defines symmetry for ParaSAILS.	160
6.2.78	$\operatorname{int}$	
	HYPRE_BoomerAMGSetLevel (HYPRE_Solver solver, int level)	
	(Optional) Defines number of levels for ParaSAILS	160
6.2.79	$\operatorname{int}$	
0.2.13	HYPRE_BoomerAMGSetThreshold (HYPRE_Solver solver,	
	HYPRE_Real threshold)	
	(Optional) Defines threshold for ParaSAILS.	161
6.2.80	$\operatorname{int}$	

	HYPRE_BoomerAMGSetFilter (HYPRE_Solver solver, HYPRE_Real filter) (Optional) Defines filter for ParaSAILS.	161
6.2.81	$\operatorname{int}$	
0.2.01	HYPRE_BoomerAMGSetDropTol (HYPRE_Solver solver, HYPRE_Real drop_tol)	
	(Optional) Defines drop tolerance for PILUT.	161
6.2.82	$\operatorname{int}$	
	HYPRE_BoomerAMGSetMaxNzPerRow (HYPRE_Solver solver, int max_nz_per_row)	
	(Optional) Defines maximal number of nonzeros for PILUT.	161
6.2.83	$\operatorname{int}$	
	HYPRE_BoomerAMGSetEuclidFile (HYPRE_Solver solver, char* euclidfile)  (Optional) Defines name of an input file for Euclid parameters	162
6.2.84	$\operatorname{int}$	
	HYPRE_BoomerAMGSetEuLevel (HYPRE_Solver solver, int eu_level)  (Optional) Defines number of levels for ILU(k) in Euclid	162
6.2.85	$\operatorname{int}$	
	HYPRE_BoomerAMGSetEuSparseA (HYPRE_Solver solver,	
	HYPRE_Real eu_sparse_A)	
	(Optional) Defines filter for $ILU(k)$ for Euclid	162
6.2.86	int	
	HYPRE_BoomerAMGSetEuBJ (HYPRE_Solver solver, int eu_bj)  (Optional) Defines use of block jacobi ILUT for Euclid	162
6.2.87	$\operatorname{int}$	
	HYPRE_BoomerAMGSetPrintLevel (HYPRE_Solver solver, int print_level)  (Optional) Requests automatic printing of setup and solve information	163
6.2.88	$\operatorname{int}$	
	HYPRE_BoomerAMGSetLogging (HYPRE_Solver solver, int logging)  (Optional) Requests additional computations for diagnostic and similar data to be logged by the user.	163
6.2.89	$\operatorname{int}$	
	HYPRE_BoomerAMGSetDebugFlag (HYPRE_Solver solver, int debug_flag) (Optional)	163
6.2.90	$\operatorname{int}$	
0.2.30	HYPRE_BoomerAMGInitGridRelaxation (int** num_grid_sweeps_ptr, int** grid_relax_type_ptr,	
	int*** grid_relax_points_ptr,	
	int coarsen_type,	
	HYPRE_Real**	
	relax_weights_ptr,	
	int max_levels) (Optional) This routine will be eliminated in the future	163
C 0 01		100
6.2.91	int HYPRE_BoomerAMGSetRAP2 (HYPRE_Solver solver, int rap2)	
	(Optional) If rap2 not equal 0, the triple matrix product RAP is replaced by two matrix products	164
6.2.92	int	101
0.4.04	1110	

 $\begin{array}{c} \textbf{HYPRE\_BoomerAMGSetKeepTranspose} \text{ (HYPRE\_Solver solver,} \\ \text{int keepTranspose)} \end{array}$ 

(Optional) If set to 1, the local interpolation transposes will be saved to use more efficient matvecs instead of matvecTs .....

Parallel unstructured algebraic multigrid solver and preconditioner

 $_{-}$  6.2.1  $_{-}$ 

int HYPRE\_BoomerAMGCreate (HYPRE\_Solver\* solver)

Create a solver object

6.2.2

int HYPRE\_BoomerAMGDestroy (HYPRE\_Solver solver)

Destroy a solver object

\_ 6.2.3 \_

int

**HYPRE\_BoomerAMGSetup** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Set up the BoomerAMG solver or preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:

solver [IN] object to be set up.

A [IN] ParCSR matrix used to construct the solver/preconditioner.

b Ignored by this function.

x Ignored by this function.

164

6.2.4

int **HYPRE\_BoomerAMGSolve** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A,
HYPRE\_ParVector b, HYPRE\_ParVector x)

Solve the system or apply AMG as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:	solver	[IN] solver or preconditioner object to be applied.
	Α	[IN] ParCSR matrix, matrix of the linear system to be
		solved
	b	[IN] right hand side of the linear system to be solved
	x	[OUT] approximated solution of the linear system to
		be solved

6.2.5

int **HYPRE\_BoomerAMGSolveT** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix
A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Solve the transpose system  $A^Tx=b$  or apply AMG as a preconditioner to the transpose system . Note that this function should only be used when preconditioning CGNR with BoomerAMG. It can only be used with Jacobi smoothing (relax\_type 0 or 7) and without CF smoothing, i.e relax\_order needs to be set to 0. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:	solver	[IN] solver or preconditioner object to be applied.
	A	[IN] ParCSR matrix
	b	[IN] right hand side of the linear system to be solved
	x	[OUT] approximated solution of the linear system to
		be solved

6.2.6

int HYPRE\_BoomerAMGSetOldDefault (HYPRE\_Solver solver)

Recovers old default for coarsening and interpolation, ie Falgout coarsening and untruncated modified classical interpolation. This option might be preferred for 2 dimensional problems.

6.2.7

int

**HYPRE\_BoomerAMGGetResidual** (HYPRE\_Solver solver, HYPRE\_ParVector\* residual)

Returns the residual

6.2.8

int

 $\label{eq:hypre_bound} \begin{aligned} \mathbf{HYPRE\_BoomerAMGGetNumIterations} & \text{ (HYPRE\_Solver solver, int* } \\ \text{num\_iterations)} \end{aligned}$ 

Returns the number of iterations taken

\_\_ 6.2.9 \_\_\_\_

int

HYPRE\_BoomerAMGGetFinalRelativeResidualNorm (HYPRE\_Solver solver, HYPRE\_Real\* rel\_resid\_norm)

Returns the norm of the final relative residual

6.2.10

int

**HYPRE\_BoomerAMGSetNumFunctions** (HYPRE\_Solver solver, int num\_functions)

(Optional) Sets the size of the system of PDEs, if using the systems version. The default is 1, i.e. a scalar system.

6211

int HYPRE\_BoomerAMGSetDofFunc (HYPRE\_Solver solver, int\* dof\_func)

(Optional) Sets the mapping that assigns the function to each variable, if using the systems version. If no assignment is made and the number of functions is k > 1, the mapping generated is (0,1,...,k-1,0,1,...,k-1,...).

6.2.12

int HYPRE\_BoomerAMGSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance, if BoomerAMG is used as a solver. If it is used as a preconditioner, it should be set to 0. The default is 1.e-7.

\_ 6.2.13 \_

int HYPRE\_BoomerAMGSetMaxIter (HYPRE\_Solver solver, int max\_iter)

(Optional) Sets maximum number of iterations, if BoomerAMG is used as a solver. If it is used as a preconditioner, it should be set to 1. The default is 20.

6.2.14

int HYPRE\_BoomerAMGSetMinIter (HYPRE\_Solver solver, int min\_iter)

(Optional)

6.2.15

int

 $\label{lem:hypre_bound} \mathbf{HYPRE\_BoomerAMGSetMaxCoarseSize} \ (\mathbf{HYPRE\_Solver} \ solver, \ int \\ \mathbf{max\_coarse\_size})$ 

(Optional) Sets maximum size of coarsest grid. The default is 9.

\_\_\_ 6.2.16 \_\_\_\_\_

int

 $\label{lem:hypre_bound} \textbf{HYPRE\_BoomerAMGSetMinCoarseSize} \ ( \textbf{HYPRE\_Solver solver}, \ \textbf{int min\_coarse\_size} )$ 

(Optional) Sets minimum size of coarsest grid. The default is 1.

\_\_ 6.2.17 \_\_\_\_\_

int

HYPRE\_BoomerAMGSetMaxLevels (HYPRE\_Solver solver, int max\_levels)

(Optional) Sets maximum number of multigrid levels. The default is 25.

\_\_ 6.2.18 \_\_\_\_\_

int

**HYPRE\_BoomerAMGSetStrongThreshold** (HYPRE\_Solver solver, HYPRE\_Real strong\_threshold)

(Optional) Sets AMG strength threshold. The default is 0.25. For 2d Laplace operators, 0.25 is a good value, for 3d Laplace operators, 0.5 or 0.6 is a better value. For elasticity problems, a large strength threshold, such as 0.9, is often better.

6.2.19

int

**HYPRE\_BoomerAMGSetSCommPkgSwitch** (HYPRE\_Solver solver, HYPRE\_Real S\_commpkg\_switch)

(Optional) Defines the largest strength threshold for which the strength matrix S uses the communication package of the operator A. If the strength threshold is larger than this values, a communication package is generated for S. This can save memory and decrease the amount of data that needs to be communicated, if S is substantially sparser than A. The default is 1.0.

\_ 6.2.20 \_\_

int **HYPRE\_BoomerAMGSetMaxRowSum** (HYPRE\_Solver solver, HYPRE\_Real max\_row\_sum)

(Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix. The default is 0.9. If max\_row\_sum is 1, no checking for diagonally dominant rows is performed.

6.2.21

int **HYPRE\_BoomerAMGSetCoarsenType** (HYPRE\_Solver solver, int coarsen\_type)

(Optional) Defines which parallel coarsening algorithm is used. There are the following options for coarsen\_type:

- 0 CLJP-coarsening (a parallel coarsening algorithm using independent sets.
- 1 | classical Ruge-Stueben coarsening on each processor, no boundary treatment (not recommended!)
- 3 classical Ruge-Stueben coarsening on each processor, followed by a third pass, which adds coarse points on the boundaries
- Falgout coarsening (uses 1 first, followed by CLJP using the interior coarse points generated by 1 as its first independent set)
- 7 | CLJP-coarsening (using a fixed random vector, for debugging purposes only)
- 8 PMIS-coarsening (a parallel coarsening algorithm using independent sets, generating lower complexities than CLJP, might also lead to slower convergence)
- 9 PMIS-coarsening (using a fixed random vector, for debugging purposes only)
- HMIS-coarsening (uses one pass Ruge-Stueben on each processor independently, followed by PMIS using the interior C-points generated as its first independent set)
- 11 one-pass Ruge-Stueben coarsening on each processor, no boundary treatment (not recommended!)
- 21 | CGC coarsening by M. Griebel, B. Metsch and A. Schweitzer
- 22 CGC-E coarsening by M. Griebel, B. Metsch and A.Schweitzer

The default is 6.

6.2.22

int

**HYPRE\_BoomerAMGSetNonGalerkinTol** (HYPRE\_Solver solver, HYPRE\_Real nongalerkin\_tol)

(Optional) Defines the non-Galerkin drop-tolerance for sparsifying coarse grid operators and thus reducing communication. Value specified here is set on all levels. This routine should be used before HYPRE\_BoomerAMGSetLevelNonGalerkinTol, which then can be used to change individual levels if desired

6.2.23  $_{-}$ 

int

HYPRE\_BoomerAMGSetLevelNonGalerkinTol (HYPRE\_Solver solver, HYPRE\_Real nongalerkin\_tol, int level)

(Optional) Defines the level specific non-Galerkin drop-tolerances for sparsifying coarse grid operators and thus reducing communication. A drop-tolerance of 0.0 means to skip doing non-Galerkin on that level. The maximum drop tolerance for a level is 1.0, although much smaller values such as 0.03 or 0.01 are recommended.

Note that if the user wants to set a specific tolerance on all levels, HYPRE\_BooemrAMGSetNonGalerkinTol should be used. Individual levels can then be changed using this routine.

In general, it is safer to drop more aggressively on coarser levels. For instance, one could use 0.0 on the finest level, 0.01 on the second level and then using 0.05 on all remaining levels. The best way to achieve this is to set 0.05 on all levels with HYPRE\_BoomerAMGSetNonGalerkinTol and then change the tolerance on level 0 to 0.0 and the tolerance on level 1 to 0.01 with HYPRE\_BoomerAMGSetLevelNonGalerkinTol. Like many AMG parameters, these drop tolerances can be tuned. It is also common to delay the start of the non-Galerkin process further to a later level than level 1.

Parameters:

solver

[IN] solver or preconditioner object to be applied.

 $nongalerkin\_tol$ 

[IN] level specific drop tolerance

level

[IN] level on which drop tolerance is used

6.2.24

int

**HYPRE\_BoomerAMGSetMeasureType** (HYPRE\_Solver solver, int measure\_type)

(Optional) Defines whether local or global measures are used

6.2.25  $_{-}$ 

HYPRE\_BoomerAMGSetAggNumLevels (HYPRE\_Solver solver, int agg\_num\_levels)

(Optional) Defines the number of levels of aggressive coarsening. The default is 0, i.e. no aggressive coarsening.

6.2.26

int

HYPRE\_BoomerAMGSetNumPaths (HYPRE\_Solver solver, int num\_paths)

(Optional) Defines the degree of aggressive coarsening. The default is 1. Larger numbers lead to less aggressive coarsening.

int HYPRE\_BoomerAMGSetCGCIts (HYPRE\_Solver solver, int its)

(optional) Defines the number of pathes for CGC-coarsening

\_ 6.2.28 \_

int HYPRE\_BoomerAMGSetNodal (HYPRE\_Solver solver, int nodal)

(Optional) Sets whether to use the nodal systems coarsening. Should be used for linear systems generated from systems of PDEs. The default is 0 (unknown-based coarsening, only coarsens within same function). For the remaining options a nodal matrix is generated by applying a norm to the nodal blocks and applying

2

Frobenius norm
sum of absolute values of elements in each block

- 3 largest element in each block (not absolute value)
- 4 row-sum norm
- 6 sum of all values in each block

 $\_$  6.2.29  $\_$ 

the coarsening algorithm to this matrix.

int

HYPRE\_BoomerAMGSetNodalDiag (HYPRE\_Solver solver, int nodal\_diag)

(Optional) Sets whether to give special treatment to diagonal elements in the nodal systems version. The default is 0. If set to 1, the diagonal entry is set to the negative sum of all off diagonal entries. If set to 2, the signs of all diagonal entries are inverted.

6.2.30

1111U

HYPRE\_BoomerAMGSetInterpType (HYPRE\_Solver solver, int interp\_type)

(Optional) Defines which parallel interpolation operator is used. There are the following options for interp\_type:

- 0 classical modified interpolation
- 1 LS interpolation (for use with GSMG)
- 2 classical modified interpolation for hyperbolic PDEs
- 3 direct interpolation (with separation of weights)
- 4 multipass interpolation
- 5 | multipass interpolation (with separation of weights)
- 6 extended+i interpolation
- 7 extended+i (if no common C neighbor) interpolation
- 8 standard interpolation
- 9 standard interpolation (with separation of weights)
- 10 classical block interpolation (for use with nodal systems version only)
- 11 classical block interpolation (for use with nodal systems version only) with diagonalized diagonal blocks
- 12 | FF interpolation
- 13 | FF1 interpolation
- 14 extended interpolation

The default is 0.

#### 6.2.31

int

**HYPRE\_BoomerAMGSetTruncFactor** (HYPRE\_Solver solver, HYPRE\_Real trunc\_factor)

(Optional) Defines a truncation factor for the interpolation. The default is 0.

### \_ 6.2.32 \_

ınt

HYPRE\_BoomerAMGSetPMaxElmts (HYPRE\_Solver solver, int P\_max\_elmts)

(Optional) Defines the maximal number of elements per row for the interpolation. The default is 0.

6.2.33

ınt

HYPRE\_BoomerAMGSetSepWeight (HYPRE\_Solver solver, int sep\_weight)

(Optional) Defines whether separation of weights is used when defining strength for standard interpolation or multipass interpolation. Default: 0, i.e. no separation of weights used.

6.2.34

int **HYPRE\_BoomerAMGSetAggInterpType** (HYPRE\_Solver solver, int agg\_interp\_type)

(Optional) Defines the interpolation used on levels of aggressive coarsening The default is 4, ie. multipass interpolation. The following options exist:

- 2-stage extended+i interpolation
- 2 | 2-stage standard interpolation
- 3 2-stage extended interpolation
- 4 | multipass interpolation

6.2.35

HYPRE\_BoomerAMGSetAggTruncFactor (HYPRE\_Solver solver, HYPRE\_Real agg\_trunc\_factor)

(Optional) Defines the truncation factor for the interpolation used for aggressive coarsening. The default is 0.

6.2.36

HYPRE\_BoomerAMGSetAggP12TruncFactor (HYPRE\_Solver solver, HYPRE\_Real agg\_P12\_trunc\_factor)

(Optional) Defines the truncation factor for the matrices P1 and P2 which are used to build 2-stage interpolation. The default is 0.

int **HYPRE\_BoomerAMGSetAggPMaxElmts** (HYPRE\_Solver solver, int agg\_P\_max\_elmts)

(Optional) Defines the maximal number of elements per row for the interpolation used for aggressive coarsening. The default is 0.

\_ 6.2.38 \_

HYPRE\_BoomerAMGSetAggP12MaxElmts (HYPRE\_Solver solver, int agg\_P12\_max\_elmts)

(Optional) Defines the maximal number of elements per row for the matrices P1 and P2 which are used to build 2-stage interpolation. The default is 0.

6.2.39

int

HYPRE\_BoomerAMGSetInterpVectors (HYPRE\_Solver solver, int num\_vectors, HYPRE\_ParVector\* interp\_vectors)

(Optional) Allows the user to incorporate additional vectors into the interpolation for systems AMG, eg. rigid body modes for linear elasticity problems. This can only be used in context with nodal coarsening and still requires the user to choose an interpolation.

6.2.40

HYPRE\_BoomerAMGSetInterpVecVariant (HYPRE\_Solver solver, int var )

(Optional) Defines the interpolation variant used for HYPRE\_BoomerAMGSetInterpVectors:

- 1 GM approach 1
- 2 GM approach 2 (to be preferred over 1)
- 3 | LN approach

int **HYPRE\_BoomerAMGSetInterpVecQMax** (HYPRE\_Solver solver, int q\_max )

(Optional) Defines the maximal elements per row for Q, the additional columns added to the original interpolation matrix P, to reduce complexity. The default is no truncation.

\_\_ 6.2.42 \_\_\_\_\_

int **HYPRE\_BoomerAMGSetInterpVecAbsQTrunc** (HYPRE\_Solver solver, HYPRE\_Real q\_trunc )

(Optional) Defines a truncation factor for Q, the additional columns added to the original interpolation matrix P, to reduce complexity. The default is no truncation.

 $_{-}$  6.2.43  $_{-}$ 

int HYPRE\_BoomerAMGSetGSMG (HYPRE\_Solver solver, int gsmg)

(Optional) Specifies the use of GSMG - geometrically smooth coarsening and interpolation. Currently any nonzero value for gsmg will lead to the use of GSMG. The default is 0, i.e. (GSMG is not used)

6.2.44

HYPRE\_BoomerAMGSetNumSamples (HYPRE\_Solver solver, int num\_samples)

(Optional) Defines the number of sample vectors used in GSMG or LS interpolation

HYPRE\_BoomerAMGSetCycleType (HYPRE\_Solver solver, int cycle\_type)

(Optional) Defines the type of cycle. For a V-cycle, set cycle\_type to 1, for a W-cycle set cycle\_type to 2. The default is 1.

6.2.46

int HYPRE\_BoomerAMGSetAdditive (HYPRE\_Solver solver, int addlvl)

(Optional) Defines use of an additive V(1,1)-cycle using the classical additive method starting at level 'addlvl'. The multiplicative approach is used on levels 0, ...'addlvl+1'. 'addlvl' needs to be > -1 for this to have an effect. Can only be used with weighted Jacobi and l1-Jacobi(default).

Can only be used when AMG is used as a preconditioner!!!

6.2.47

int HYPRE\_BoomerAMGSetMultAdditive (HYPRE\_Solver solver, int addlvl)

(Optional) Defines use of an additive V(1,1)-cycle using the mult-additive method starting at level 'addlvl'. The multiplicative approach is used on levels 0, ...'addlvl+1'. 'addlvl' needs to be > -1 for this to have an effect. Can only be used with weighted Jacobi and l1-Jacobi(default).

Can only be used when AMG is used as a preconditioner!!!

6.2.48

int HYPRE\_BoomerAMGSetSimple (HYPRE\_Solver solver, int addlvl)

(Optional) Defines use of an additive V(1,1)-cycle using the simplified mult-additive method starting at level 'addlvl'. The multiplicative approach is used on levels 0, ...'addlvl+1'. 'addlvl' needs to be > -1 for this to have an effect. Can only be used with weighted Jacobi and l1-Jacobi(default).

Can only be used when AMG is used as a preconditioner !!!

\_ 6.2.49 \_

int

HYPRE\_BoomerAMGSetAddLastLvl (HYPRE\_Solver solver, int add\_last\_lvl)

(Optional) Defines last level where additive, mult-additive or simple cycle is used. The multiplicative approach is used on levels > add\_last\_lvl.

Can only be used when AMG is used as a preconditioner!!!

6.2.50

int

**HYPRE\_BoomerAMGSetMultAddTruncFactor** (HYPRE\_Solver solver, HYPRE\_Real add\_trunc\_factor)

(Optional) Defines the truncation factor for the smoothed interpolation used for mult-additive or simple method. The default is 0.

6.2.51

int

HYPRE\_BoomerAMGSetMultAddPMaxElmts (HYPRE\_Solver solver, int add\_P\_max\_elmts)

(Optional) Defines the maximal number of elements per row for the smoothed interpolation used for multadditive or simple method. The default is 0.

HYPRE\_BoomerAMGSetAddRelaxType (HYPRE\_Solver solver, int add\_rlx\_type)

(Optional) Defines the relaxation type used in the (mult)additive cycle portion (also affects simple method) The default is 18 (L1-Jacobi). Currently the only other option allowed is 0 (Jacobi) which should be used in combination with HYPRE\_BoomerAMGSetAddRelaxWt.

\_\_ 6.2.53 \_\_\_

HYPRE\_BoomerAMGSetAddRelaxWt (HYPRE\_Solver solver, HYPRE\_Real add\_rlx\_wt)

(Optional) Defines the relaxation weight used for Jacobi within the (mult)additive or simple cycle portion. The default is 1. The weight only affects the Jacobi method, and has no effect on L1-Jacobi

6.2.54

HYPRE\_BoomerAMGSetSeqThreshold (HYPRE\_Solver solver, int seq\_threshold)

(Optional) Sets maximal size for agglomeration or redundant coarse grid solve. When the system is smaller than this threshold, sequential AMG is used on process 0 or on all remaining active processes (if redundant = 1).

6.2.55

HYPRE\_BoomerAMGSetRedundant (HYPRE\_Solver solver, int redundant)

(Optional) operates switch for redundancy. Needs to be used with HYPRE\_BoomerAMGSetSeqThreshold. Default is 0, i.e. no redundancy.

int

HYPRE\_BoomerAMGSetNumSweeps (HYPRE\_Solver solver, int num\_sweeps)

(Optional) Sets the number of sweeps. On the finest level, the up and the down cycle the number of sweeps are set to num\_sweeps and on the coarsest level to 1. The default is 1.

\_\_ 6.2.57 \_\_\_

HYPRE\_BoomerAMGSetCycleNumSweeps (HYPRE\_Solver solver, int num\_sweeps, int k)

(Optional) Sets the number of sweeps at a specified cycle. There are the following options for k:

the down cycle	if k=1
the up cycle	if k=2
the coarsest level	if $k=3$ .

 $_{-}$  6.2.58  $_{-}$ 

int **HYPRE\_BoomerAMGSetGridRelaxType** (HYPRE\_Solver solver, int\* grid\_relax\_type)

(Optional) Defines which smoother is used on the fine and coarse grid, the up and down cycle.

Note: This routine will be phased out!!!! Use HYPRE\_BoomerAMGSetRelaxType or HYPRE\_BoomerAMGSetCycleRelaxType instead.

\_ 6.2.59 \_

int

HYPRE\_BoomerAMGSetRelaxType (HYPRE\_Solver solver, int relax\_type)

(Optional) Defines the smoother to be used. It uses the given smoother on the fine grid, the up and the down cycle and sets the solver on the coarsest level to Gaussian elimination (9). The default is Gauss-Seidel (3).

There are the following options for relax\_type:

- 0 Jacobi
- 1 Gauss-Seidel, sequential (very slow!)
- 2 Gauss-Seidel, interior points in parallel, boundary sequential (slow!)
- 3 hybrid Gauss-Seidel or SOR, forward solve
- 4 hybrid Gauss-Seidel or SOR, backward solve
- 5 hybrid chaotic Gauss-Seidel (works only with OpenMP)
- 6 hybrid symmetric Gauss-Seidel or SSOR
- 8  $\ell_1$ -scaled hybrid symmetric Gauss-Seidel
- 9 Gaussian elimination (only on coarsest level)
- 15 CG (warning not a fixed smoother may require FGMRES)
- 16 Chebyshev
- 17 FCF-Jacobi
- 18  $\ell_1$ -scaled jacobi

6.2.60

int **HYPRE\_BoomerAMGSetCycleRelaxType** (HYPRE\_Solver solver, int relax\_type, int k)

(Optional) Defines the smoother at a given cycle. For options of relax\_type see description of HYPRE\_BoomerAMGSetRelaxType). Options for k are

the down cycle	if k=1
the up cycle	if k=2
the coarsest level	if k=3.

6.2.61  $\_$ 

HYPRE\_BoomerAMGSetRelaxOrder (HYPRE\_Solver solver, int relax\_order)

(Optional) Defines in which order the points are relaxed. There are the following options for relax\_order:

- 0 the points are relaxed in natural or lexicographic order on each processor
- 1 CF-relaxation is used, i.e on the fine grid and the down cycle the coarse points are relaxed first, followed by the fine points; on the up cycle the F-points are relaxed first, followed by the C-points. On the coarsest level, if an iterative scheme is used, the points are relaxed in lexicographic order.

The default is 1 (CF-relaxation).

\_\_ 6.2.62 \_\_

HYPRE\_BoomerAMGSetRelaxWt (HYPRE\_Solver solver, HYPRE\_Real relax\_weight)

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.

$relax_weight > 0$	this assigns the given relaxation weight on all levels
$relax_weight = 0$	the weight is determined on each level with the estimate $\frac{3}{4\ D^{-1/2}AD^{-1/2}\ }$ ,
	where $D$ is the diagonal matrix of $A$ (this should only be used with Jacobi)
$relax_weight = -k$	the relaxation weight is determined with at most k CG steps on each level
	this should only be used for symmetric positive definite problems)

The default is 1.

\_ 6.2.63 \_

HYPRE\_BoomerAMGSetLevelRelaxWt (HYPRE\_Solver solver, HYPRE\_Real relax\_weight, int level)

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive relax\_weight, the parameter is determined on the given level as described for HYPRE\_BoomerAMGSetRelaxWt. The default is 1.

\_ 6.2.64 \_\_\_

HYPRE\_BoomerAMGSetOmega (HYPRE\_Solver solver, HYPRE\_Real\* omega)

(Optional) Defines the outer relaxation weight for hybrid SOR. Note: This routine will be phased out!!!! Use HYPRE\_BoomerAMGSetOuterWt or HYPRE\_BoomerAMGSetLevelOuterWt instead.

HYPRE\_BoomerAMGSetOuterWt (HYPRE\_Solver solver, HYPRE\_Real omega)

(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels.

omega > 0	this assigns the same outer relaxation weight omega on each level
omega = -k	an outer relaxation weight is determined with at most k CG steps on each level
	(this only makes sense for symmetric positive definite problems and smoothers, e.g. SSOR)

The default is 1.

6.2.66

int **HYPRE\_BoomerAMGSetLevelOuterWt** (HYPRE\_Solver solver, HYPRE\_Real omega, int level)

(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive omega, the parameter is determined on the given level as described for HYPRE\_BoomerAMGSetOuterWt. The default is 1.

\_ 6.2.67 \_\_\_\_

int HYPRE\_BoomerAMGSetChebyOrder (HYPRE\_Solver solver, int order)

(Optional) Defines the Order for Chebyshev smoother. The default is 2 (valid options are 1-4).

\_ 6.2.68 \_\_\_

int **HYPRE\_BoomerAMGSetChebyFraction** (HYPRE\_Solver solver, HYPRE\_Real ratio)

(Optional) Fraction of the spectrum to use for the Chebyshev smoother. The default is .3 (i.e., damp on upper 30% of the spectrum).

\_ 6.2.69 \_

int **HYPRE\_BoomerAMGSetSmoothType** (HYPRE\_Solver solver, int smooth\_type)

(Optional) Enables the use of more complex smoothers. The following options exist for smooth\_type:

value	smoother	routines needed to set smoother parameters
6	Schwarz smoothers	HYPRE_BoomerAMGSetDomainType, HYPRE_BoomerAMGSetOverlap,
		HYPRE_BoomerAMGSetVariant, HYPRE_BoomerAMGSetSchwarzRlxWeight
7	Pilut	HYPRE_BoomerAMGSetDropTol, HYPRE_BoomerAMGSetMaxNzPerRow
8	ParaSails	HYPRE_BoomerAMGSetSym, HYPRE_BoomerAMGSetLevel,
		HYPRE_BoomerAMGSetFilter, HYPRE_BoomerAMGSetThreshold
9	Euclid	HYPRE_BoomerAMGSetEuclidFile

The default is 6. Also, if no smoother parameters are set via the routines mentioned in the table above, default values are used.

6.2.70

HYPRE\_BoomerAMGSetSmoothNumLevels (HYPRE\_Solver solver, int smooth\_num\_levels)

(Optional) Sets the number of levels for more complex smoothers. The smoothers, as defined by HYPRE\_BoomerAMGSetSmoothType, will be used on level 0 (the finest level) through level smooth\_num\_levels-1. The default is 0, i.e. no complex smoothers are used.

6.2.71

HYPRE\_BoomerAMGSetSmoothNumSweeps (HYPRE\_Solver solver, int smooth\_num\_sweeps)

(Optional) Sets the number of sweeps for more complex smoothers. The default is 1.

int HYPRE\_BoomerAMGSetVariant (HYPRE\_Solver solver, int variant)

(Optional) Defines which variant of the Schwarz method is used. The following options exist for variant:

- 0 hybrid multiplicative Schwarz method (no overlap across processor boundaries)
- 1 hybrid additive Schwarz method (no overlap across processor boundaries)
- 2 | additive Schwarz method
- 3 hybrid multiplicative Schwarz method (with overlap across processor boundaries)

The default is 0.

6.2.73

int HYPRE\_BoomerAMGSetOverlap (HYPRE\_Solver solver, int overlap)

(Optional) Defines the overlap for the Schwarz method. The following options exist for overlap:

- 0 no overlap
- | minimal overlap (default)
- 2 overlap generated by including all neighbors of domain boundaries

6.2.74 \_

HYPRE\_BoomerAMGSetDomainType (HYPRE\_Solver solver, int domain\_type)

(Optional) Defines the type of domain used for the Schwarz method. The following options exist for domain\_type:

- 0 each point is a domain
- 1 | each node is a domain (only of interest in "systems" AMG)
- 2 each domain is generated by agglomeration (default)

HYPRE\_BoomerAMGSetSchwarzRlxWeight (HYPRE\_Solver solver, HYPRE\_Real schwarz\_rlx\_weight)

(Optional) Defines a smoothing parameter for the additive Schwarz method

\_\_\_ 6.2.76 \_\_\_\_

int

 $\label{lem:hypre_bound} \mbox{\bf HYPRE\_BoomerAMGSetSchwarzUseNonSymm (HYPRE\_Solver solver, intuse\_nonsymm)}$ 

(Optional) Indicates that the aggregates may not be SPD for the Schwarz method. The following options exist for use\_nonsymm:

- 0 assume SPD (default)
  1 assume non-symmetric
  - \_ 6.2.77 \_

int HYPRE\_BoomerAMGSetSym (HYPRE\_Solver solver, int sym)

 $(Optional)\ Defines\ symmetry\ for\ ParaSAILS.\ For\ further\ explanation\ see\ description\ of\ ParaSAILS.$ 

\_\_ 6.2.78 \_\_\_\_\_

int HYPRE\_BoomerAMGSetLevel (HYPRE\_Solver solver, int level)

(Optional) Defines number of levels for ParaSAILS. For further explanation see description of ParaSAILS.

HYPRE\_BoomerAMGSetThreshold (HYPRE\_Solver solver, HYPRE\_Real threshold)

(Optional) Defines threshold for ParaSAILS. For further explanation see description of ParaSAILS.

\_\_\_ 6.2.80 \_\_\_\_

 $int \ \mathbf{HYPRE\_BoomerAMGSetFilter} \ (HYPRE\_Solver \ solver, \ HYPRE\_Real \ filter)$ 

(Optional) Defines filter for ParaSAILS. For further explanation see description of ParaSAILS.

\_ 6.2.81 \_\_

int

 $\label{eq:hypre_bound} \begin{aligned} \mathbf{HYPRE\_BoomerAMGSetDropTol} \ (\mathbf{HYPRE\_Solver} \ solver, \ \mathbf{HYPRE\_Real} \\ \mathbf{drop\_tol}) \end{aligned}$ 

(Optional) Defines drop tolerance for PILUT. For further explanation see description of PILUT.

6.2.82

int **HYPRE\_BoomerAMGSetMaxNzPerRow** (HYPRE\_Solver solver, int max\_nz\_per\_row)

(Optional) Defines maximal number of nonzeros for PILUT. For further explanation see description of PILUT.

int **HYPRE\_BoomerAMGSetEuclidFile** (HYPRE\_Solver solver, char\* euclidfile)

(Optional) Defines name of an input file for Euclid parameters. For further explanation see description of Euclid.

\_\_ 6.2.84 \_\_\_\_\_

int HYPRE\_BoomerAMGSetEuLevel (HYPRE\_Solver solver, int eu\_level)

(Optional) Defines number of levels for ILU(k) in Euclid. For further explanation see description of Euclid.

6.2.85

HYPRE\_BoomerAMGSetEuSparseA (HYPRE\_Solver solver, HYPRE\_Real eu\_sparse\_A)

(Optional) Defines filter for ILU(k) for Euclid. For further explanation see description of Euclid.

6.2.86

int HYPRE\_BoomerAMGSetEuBJ (HYPRE\_Solver solver, int eu\_bj)

(Optional) Defines use of block jacobi ILUT for Euclid. For further explanation see description of Euclid.

int HYPRE\_BoomerAMGSetPrintLevel (HYPRE\_Solver solver, int print\_level)

(Optional) Requests automatic printing of setup and solve information.

- 0 no printout (default)
- 1 print setup information
- 2 print solve information
- 3 print both setup and solve information

Note, that if one desires to print information and uses BoomerAMG as a preconditioner, suggested print\_level is 1 to avoid excessive output, and use print\_level of solver for solve phase information.

6.2.88

int HYPRE\_BoomerAMGSetLogging (HYPRE\_Solver solver, int logging)

(Optional) Requests additional computations for diagnostic and similar data to be logged by the user. Default to 0 for do nothing. The latest residual will be available if logging > 1.

\_\_ 6.2.89 \_\_\_\_

HYPRE\_BoomerAMGSetDebugFlag (HYPRE\_Solver solver, int debug\_flag)

(Optional)

6.2.90

int

**HYPRE\_BoomerAMGInitGridRelaxation** (int\*\* num\_grid\_sweeps\_ptr, int\*\* grid\_relax\_type\_ptr, int\*\*\* grid\_relax\_points\_ptr, int coarsen\_type, HYPRE\_Real\*\* relax\_weights\_ptr, int max\_levels)

(Optional) This routine will be eliminated in the future

int HYPRE\_BoomerAMGSetRAP2 (HYPRE\_Solver solver, int rap2)

(Optional) If rap2 not equal 0, the triple matrix product RAP is replaced by two matrix products

\_ 6.2.92 \_\_\_\_

int **HYPRE\_BoomerAMGSetKeepTranspose** (HYPRE\_Solver solver, int keepTranspose)

(Optional) If set to 1, the local interpolation transposes will be saved to use more efficient matvecs instead of matvecTs

6.3

Parallel sparse approximate inverse preconditioner for the ParCSR matrix format.

\_ 6.3.1 \_

int HYPRE\_ParaSailsCreate (MPI\_Comm comm, HYPRE\_Solver\* solver)

Create a ParaSails preconditioner

\_ 6.3.2 \_

int HYPRE\_ParaSailsDestroy (HYPRE\_Solver solver)

Destroy a ParaSails preconditioner

\_\_ 6.3.3 \_\_

HYPRE\_ParaSailsSetup (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Set up the ParaSails preconditioner. This function should be passed to the iterative solver SetPrecond function.

Parameters: solver [IN] Preconditioner object to set up.

A [IN] ParCSR matrix used to construct the precondi-

tioner.

b Ignored by this function.x Ignored by this function.

6.3.4

HYPRE\_ParaSailsSolve (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Apply the ParaSails preconditioner. This function should be passed to the iterative solver SetPrecond function.

Parameters: solver [IN] Preconditioner object to apply.

A Ignored by this function.
b [IN] Vector to precondition.
x [OUT] Preconditioned vector.

6.3.5 \_

int **HYPRE\_ParaSailsSetParams** (HYPRE\_Solver solver, HYPRE\_Real thresh, int nlevels)

Set the threshold and levels parameter for the ParaSails preconditioner. The accuracy and cost of ParaSails are parameterized by these two parameters. Lower values of the threshold parameter and higher values of levels parameter lead to more accurate, but more expensive preconditioners.

Parameters: solver [IN] Preconditioner object for which to set parameters.

thresh [IN] Value of threshold parameter,  $0 \le \text{thresh} \le 1$ . The

deault valuue is 0.1.

nlevels [IN] Value of levels parameter,  $0 \le$  nlevels. The dfault

valuue is 1.

6.3.6

int HYPRE\_ParaSailsSetFilter (HYPRE\_Solver solver, HYPRE\_Real filter)

Set the filter parameter for the ParaSails preconditioner.

Parameters: solver [IN] Preconditioner object for which to set filter pa-

rameter.

filter [IN] Value of filter parameter. The filter parameter

is used to drop small nonzeros in the preconditioner, to reduce the oost of applying the preconditiner. Values from 0055 to 0.1 arre recommended. The efault value

is 0.1.

6.3.7

int HYPRE\_ParaSailsSetSym (HYPRE\_Solver solver, int sym)

Set the symmetry parameter for the ParaSails preconditioner.

value	meaning
0	nonsymmetric and/or indefinite problem, and nonsymmetric preconditioner
1	SPD problem, and SPD (factored) preconditioner
2	nonsymmetric, definite problem, and SPD (factored) preconditioner

Parameters: solver [IN] Preconditioner object for which to set symmetry

parameter.

sym [IN] Symmetry parameter.

6.3.8

int HYPRE\_ParaSailsSetLoadbal (HYPRE\_Solver solver, HYPRE\_Real loadbal)

Set the load balance parameter for the ParaSails preconditioner.

Parameters:

solver

[IN] Preconditioner object for which to set the load balance parameter.

loadbal

[IN] Value of the load balance parameter,  $0 \le \text{loadbl} \le 1$ . A zero value indicates that no load alance is attempted; a value of unity indicate tat perfect llooad balance will be attempted. The recommended viee is 0.9 to balance the overhead of data exchanges for load balancing. No load balancing is needd if thee preeconditioner is vey sparse and fast o construct. The default value when this paameter is not see iis 0.

6.3.9

int HYPRE\_ParaSailsSetReuse (HYPRE\_Solver solver, int reuse)

Set the pattern reuse parameter for the ParaSails preconditioner.

Parameters:

solver

[IN] Preconditioner object for which to set the pattern

reuse parameter.

reuse

[IN] Value of the pattern reuse parameter. A nonzero value indicaes that the pattern of the preconditioner should be reused for subsequent constructions of the preconditioner.. A zero value indicates that the preconditioner should be constructed from scratch. The default value when this parameter is not se iis 0.

6.3.10

int HYPRE\_ParaSailsSetLogging (HYPRE\_Solver solver, int logging)

Set the logging parameter for the ParaSails preconditioner.

Parameters:

solver

[IN] Preconditioner object for which to set the logging-

parameter.

logging

[IN] Value of the logging parameter. A nonzero valuesed statistics of the setup procedure to stdout. The

default value when this parameter is not set is 0.

#### 6.3.11

HYPRE\_ParaSailsBuildIJMatrix (HYPRE\_Solver solver, HYPRE\_IJMatrix\* pij\_A)

Build IJ Matrix of the sparse approximate inverse (factor). This function explicitly creates the IJ Matrix corresponding to the sparse approximate inverse or the inverse factor. Example: HYPRE\_IJMatrix ij\_A; HYPRE\_ParaSailsBuildIJMatrix(solver, &ij\_A);

Parameters:

solver [IN] Preconditioner object.
pij\_A [OUT] Pointer to the IJ Matrix.

\_ 6.4

# ParCSR Euclid Preconditioner

Names		
6.4.1	int  HYPRE_EuclidCreate (MPI_Comm comm, HYPRE_Solver* solver)  Create a Euclid object	170
6.4.2	int HYPRE_EuclidDestroy (HYPRE_Solver solver)  Destroy a Euclid object	171
6.4.3	int  HYPRE_EuclidSetup (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  HYPRE_ParVector b, HYPRE_ParVector x)  Set up the Euclid preconditioner.	171
6.4.4	int  HYPRE_EuclidSolve (HYPRE_Solver solver, HYPRE_ParCSRMatrix A,  HYPRE_ParVector b, HYPRE_ParVector x)  Apply the Euclid preconditioner.	171
6.4.5	int  HYPRE_EuclidSetParams (HYPRE_Solver solver, int argc, char* argv[])  Insert (name, value) pairs in Euclid's options database by passing Euclid the command line (or an array of strings).	172
6.4.6	int  HYPRE_EuclidSetParamsFromFile (HYPRE_Solver solver, char* filename)  Insert (name, value) pairs in Euclid's options database	172
6.4.7	int  HYPRE_EuclidSetLevel (HYPRE_Solver solver, int level)  Set level k for ILU(k) factorization, default: 1	172
6.4.8	$\operatorname{int}$	

	HYPRE_EuclidSetBJ (HYPRE_Solver solver, int bj)	
	Use block Jacobi ILU preconditioning instead of PILU	173
6.4.9	$\operatorname{int}$	
	HYPRE_EuclidSetStats (HYPRE_Solver solver, int eu_stats)	
	If eu_stats not equal 0, a summary of runtime settings and timing information is printed to stdout	173
6.4.10	$\operatorname{int}$	
	HYPRE_EuclidSetMem (HYPRE_Solver solver, int eu_mem)	
	If eu_mem not equal 0, a summary of Euclid's memory usage is printed to stdout	173
6.4.11	$\operatorname{int}$	
	<b>HYPRE_EuclidSetSparseA</b> (HYPRE_Solver solver, HYPRE_Real sparse_A)	
	Defines a drop tolerance for $ILU(k)$	173
6.4.12	$\operatorname{int}$	
	HYPRE_EuclidSetRowScale (HYPRE_Solver solver, int row_scale)	
	If row_scale not equal 0, values are scaled prior to factorization so that	
	largest value in any row is +1 or -1.	173
6.4.13	$\operatorname{int}$	
	HYPRE_EuclidSetILUT (HYPRE_Solver solver, HYPRE_Real drop_tol)	
	uses ILUT and defines a drop tolerance relative to the largest absolute value	
	of any entry in the row being factored	174

# MPI Parallel ILU preconditioner

## Options summary:

Option	Default	Synopsis
-level	1	ILU(k) factorization level
-bj	0 (false)	Use Block Jacobi ILU instead of PILU
-eu_stats	0 (false)	Print internal timing and statistics
-eu_mem	0 (false)	Print internal memory usage

6.4.1

 $int \ \mathbf{HYPRE\_EuclidCreate} \ (\mathrm{MPI\_Comm} \ \mathrm{comm}, \ \mathrm{HYPRE\_Solver*} \ \mathrm{solver})$ 

Create a Euclid object

6.4.2

int HYPRE\_EuclidDestroy (HYPRE\_Solver solver)

Destroy a Euclid object

 $\_$  6.4.3  $\_$ 

int

**HYPRE\_EuclidSetup** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Set up the Euclid preconditioner. This function should be passed to the iterative solver SetPrecond function.

Parameters: solver [IN] Preconditioner object to set up.

A [IN] ParCSR matrix used to construct the precondi-

tioner.

b Ignored by this function.x Ignored by this function.

\_ 6.4.4 \_

int

**HYPRE\_EuclidSolve** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Apply the Euclid preconditioner. This function should be passed to the iterative solver SetPrecond function.

Parameters: solver [IN] Preconditioner object to apply.

A Ignored by this function.
b [IN] Vector to precondition.
x [OUT] Preconditioned vector.

6.4.5

int HYPRE\_EuclidSetParams (HYPRE\_Solver solver, int argc, char\* argv[])

Insert (name, value) pairs in Euclid's options database by passing Euclid the command line (or an array of strings). All Euclid options (e.g, level, drop-tolerance) are stored in this database. If a (name, value) pair already exists, this call updates the value. See also: HYPRE\_EuclidSetParamsFromFile.

Parameters:

argc [IN] Length of argv array argv [IN] Array of strings

6.4.6

int HYPRE\_EuclidSetParamsFromFile (HYPRE\_Solver solver, char\* filename)

Insert (name, value) pairs in Euclid's options database. Each line of the file should either begin with a "#," indicating a comment line, or contain a (name value) pair, e.g.

>cat optionsFile #sample runtime parameter file -blockJacobi 3 -matFile /home/hysom/myfile.euclid -doSomething true -xx\_coeff -1.0

See also:  $HYPRE\_EuclidSetParams$ .

Parameters: filename [IN] Pathname/filename to read

6.4.7 \_

int HYPRE\_EuclidSetLevel (HYPRE\_Solver solver, int level)

Set level k for ILU(k) factorization, default: 1

\_\_ 6.4.8 \_\_\_\_

int HYPRE\_EuclidSetBJ (HYPRE\_Solver solver, int bj)

Use block Jacobi ILU preconditioning instead of PILU

\_\_ 6.4.9 \_\_\_\_\_

int HYPRE\_EuclidSetStats (HYPRE\_Solver solver, int eu\_stats)

If eu\_stats not equal 0, a summary of runtime settings and timing information is printed to stdout

6.4.10

int HYPRE\_EuclidSetMem (HYPRE\_Solver solver, int eu\_mem)

If eu\_mem not equal 0, a summary of Euclid's memory usage is printed to stdout

\_ 6.4.11 \_\_\_\_

int **HYPRE\_EuclidSetSparseA** (HYPRE\_Solver solver, HYPRE\_Real sparse\_A)

Defines a drop tolerance for  $\mathrm{ILU}(k)$ . Default: 0 Use with HYPRE\_EuclidSetRowScale. Note that this can destroy symmetry in a matrix.

6.4.12

int HYPRE\_EuclidSetRowScale (HYPRE\_Solver solver, int row\_scale)

If row\_scale not equal 0, values are scaled prior to factorization so that largest value in any row is +1 or -1. Note that this can destroy symmetry in a matrix.

#### 6.4.13

int **HYPRE\_EuclidSetILUT** (HYPRE\_Solver solver, HYPRE\_Real drop\_tol)

uses ILUT and defines a drop tolerance relative to the largest absolute value of any entry in the row being factored

## \_ 6.5 \_

## HYPRE\_AMSProjectOutGradients (HYPRE\_Solver solver, HYPRE\_ParVector x) For problems with zero-conductivity regions, project the vector onto the compatible subspace: $x = (I - G_0(G_0^t G_0)^{-1} G_0^T)x$ , where $G_0$ is the discrete gradient restricted to the interior nodes of the regions with zero conductivity. 186 6.6.26 int HYPRE\_AMSConstructDiscreteGradient (HYPRE\_ParCSRMatrix A. HYPRE\_ParVector x\_coord, int\* edge\_vertex, int edge\_orientation, HYPRE\_ParCSRMatrix\* G) $Construct\ and\ return\ the\ lowest-order\ discrete\ gradient\ matrix\ G\ using\ some$ 186

Parallel auxiliary space Maxwell solver and preconditioner

6.6.1

int HYPRE\_AMSCreate (HYPRE\_Solver\* solver)

Create an AMS solver object

6.6.2

int HYPRE\_AMSDestroy (HYPRE\_Solver solver)

Destroy an AMS solver object

\_ 6.6.3 \_\_\_

HYPRE\_AMSSetup (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Set up the AMS solver or preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:	solver A	[IN] object to be set up. [IN] ParCSR matrix used to construct the solver/preconditioner.
	b	Ignored by this function.
	x	Ignored by this function.

6.6.4

HYPRE\_AMSSolve (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Solve the system or apply AMS as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:	solver A	<ul><li>[IN] solver or preconditioner object to be applied.</li><li>[IN] ParCSR matrix, matrix of the linear system to be solved</li></ul>
	b	[IN] right hand side of the linear system to be solved
	x	[OUT] approximated solution of the linear system to
	*	be solved

 $\_$  6.6.5  $\_$ 

int HYPRE\_AMSSetDimension (HYPRE\_Solver solver, int dim)

(Optional) Sets the problem dimension (2 or 3). The default is 3.

6.6.6

int
HYPRE\_AMSSetDiscreteGradient (HYPRE\_Solver solver,
HYPRE\_ParCSRMatrix G)

Sets the discrete gradient matrix G. This function should be called before HYPRE\_AMSSetup()!

6.6.7

int
HYPRE\_AMSSetCoordinateVectors (HYPRE\_Solver solver,
HYPRE\_ParVector x, HYPRE\_ParVector y, HYPRE\_ParVector z)

Sets the x, y and z coordinates of the vertices in the mesh.

Either HYPRE\_AMSSetCoordinateVectors() or HYPRE\_AMSSetEdgeConstantVectors() should be called before HYPRE\_AMSSetup()!

6.6.8

int
HYPRE\_AMSSetEdgeConstantVectors (HYPRE\_Solver solver,
HYPRE\_ParVector Gx, HYPRE\_ParVector Gy, HYPRE\_ParVector Gz)

Sets the vectors Gx, Gy and Gz which give the representations of the constant vector fields (1,0,0), (0,1,0) and (0,0,1) in the edge element basis.

Either HYPRE\_AMSSetCoordinateVectors() or HYPRE\_AMSSetEdgeConstantVectors() should be called before HYPRE\_AMSSetup()!

\_ 6.6.9 \_

int
HYPRE\_AMSSetInterpolations (HYPRE\_Solver solver,
HYPRE\_ParCSRMatrix Pi, HYPRE\_ParCSRMatrix Pix, HYPRE\_ParCSRMatrix Piy, HYPRE\_ParCSRMatrix Piz)

(Optional) Set the (components of) the Nedelec interpolation matrix  $\Pi = [\Pi^x, \Pi^y, \Pi^z]$ .

This function is generally intended to be used only for high-order Nedelec discretizations (in the lowest order case,  $\Pi$  is constructed internally in AMS from the discreet gradient matrix and the coordinates of the vertices), though it can also be used in the lowest-order case or for other types of discretizations (e.g. ones based on the second family of Nedelec elements).

By definition,  $\Pi$  is the matrix representation of the linear operator that interpolates (high-order) vector nodal finite elements into the (high-order) Nedelec space. The component matrices are defined as  $\Pi^x \varphi = \Pi(\varphi, 0, 0)$  and similarly for  $\Pi^y$  and  $\Pi^z$ . Note that all these operators depend on the choice of the basis and degrees of freedom in the high-order spaces.

The column numbering of Pi should be node-based, i.e. the x/y/z components of the first node (vertex or high-order dof) should be listed first, followed by the x/y/z components of the second node and so on (see the documentation of HYPRE\_BoomerAMGSetDofFunc).

If used, this function should be called before HYPRE\_AMSSetup() and there is no need to provide the vertex coordinates. Furthermore, only one of the sets  $\{\Pi\}$  and  $\{\Pi^x, \Pi^y, \Pi^z\}$  needs to be specified (though it is OK to provide both). If Pix is NULL, then scalar  $\Pi$ -based AMS cycles, i.e. those with cycle\_type > 10, will be unavailable. Similarly, AMS cycles based on monolithic  $\Pi$  (cycle\_type < 10) require that Pi is not NULL.

6.6.10

HYPRE\_AMSSetAlphaPoissonMatrix (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A\_alpha)

(Optional) Sets the matrix  $A_{\alpha}$  corresponding to the Poisson problem with coefficient  $\alpha$  (the curl-curl term coefficient in the Maxwell problem).

If this function is called, the coarse space solver on the range of  $\Pi^T$  is a block-diagonal version of  $A_{\Pi}$ . If this function is not called, the coarse space solver on the range of  $\Pi^T$  is constructed as  $\Pi^T A \Pi$  in HYPRE\_AMSSetup(). See the user's manual for more details.

\_ 6.6.11 \_\_

int **HYPRE\_AMSSetBetaPoissonMatrix** (HYPRE\_Solver solver,
HYPRE\_ParCSRMatrix A\_beta)

(Optional) Sets the matrix  $A_{\beta}$  corresponding to the Poisson problem with coefficient  $\beta$  (the mass term coefficient in the Maxwell problem).

If not given, the Poisson matrix will be computed in HYPRE\_AMSSetup(). If the given matrix is NULL, we assume that  $\beta$  is identically 0 and use two-level (instead of three-level) methods. See the user's manual for more details.

 $_{-}$  6.6.12  $_{-}$ 

HYPRE\_AMSSetInteriorNodes (HYPRE\_Solver solver, HYPRE\_ParVector interior\_nodes)

(Optional) Set the list of nodes which are interior to a zero-conductivity region. This way, a more robust solver is constructed, that can be iterated to lower tolerance levels. A node is interior if its entry in the array is 1.0. This function should be called before HYPRE\_AMSSetup()!

6.6.13

int **HYPRE\_AMSSetProjectionFrequency** (HYPRE\_Solver solver, int projection\_frequency)

(Optional) Set the frequency at which a projection onto the compatible subspace for problems with zero-conductivity regions is performed. The default value is 5.

6.6.14

int HYPRE\_AMSSetMaxIter (HYPRE\_Solver solver, int maxit)

(Optional) Sets maximum number of iterations, if AMS is used as a solver. To use AMS as a preconditioner, set the maximum number of iterations to 1. The default is 20.

 $_{-}$  6.6.15  $_{-}$ 

int HYPRE\_AMSSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance, if AMS is used as a solver. When using AMS as a preconditioner, set the tolerance to 0.0. The default is  $10^{-6}$ .

6.6.16

int HYPRE\_AMSSetCycleType (HYPRE\_Solver solver, int cycle\_type)

(Optional) Choose which three-level solver to use. Possible values are:

- 1 3-level multiplicative solver (01210)
- 2 | 3-level additive solver (0+1+2)
- 3 | 3-level multiplicative solver (02120)
- 4 | 3-level additive solver (010+2)
- 5 | 3-level multiplicative solver (0102010)
- 6 3-level additive solver (1+020)
- 7 | 3-level multiplicative solver (0201020)
- 8 | 3-level additive solver (0(1+2)0)
- 11 | 5-level multiplicative solver (013454310)
- 12 | 5-level additive solver (0+1+3+4+5)
- 13 | 5-level multiplicative solver (034515430)
- 14 | 5-level additive solver (01(3+4+5)10)

The default is 1. See the user's manual for more details.

6.6.17

int HYPRE\_AMSSetPrintLevel (HYPRE\_Solver solver, int print\_level)

(Optional) Control how much information is printed during the solution iterations. The default is 1 (print residual norm at each step).

6.6.18

int

**HYPRE\_AMSSetSmoothingOptions** (HYPRE\_Solver solver, int relax\_type, int relax\_times, HYPRE\_Real relax\_weight, HYPRE\_Real omega)

(Optional) Sets relaxation parameters for A. The defaults are 2, 1, 1.0, 1.0.

The available options for relax\_type are:

- 1  $\ell_1$ -scaled Jacobi
- 2  $\ell_1$ -scaled block symmetric Gauss-Seidel/SSOR
- 3 | Kaczmarz
- 4 | truncated version of  $\ell_1$ -scaled block symmetric Gauss-Seidel/SSOR
- 16 Chebyshev

6.6.19

int

HYPRE\_AMSSetAlphaAMGOptions (HYPRE\_Solver solver, int alpha\_coarsen\_type, int alpha\_agg\_levels, int alpha\_relax\_type, HYPRE\_Real alpha\_strength\_threshold, int alpha\_interp\_type, int alpha\_Pmax)

(Optional) Sets AMG parameters for  $B_{\Pi}$ . The defaults are 10, 1, 3, 0.25, 0, 0. See the user's manual for more details.

6.6.20

int

**HYPRE\_AMSSetAlphaAMGCoarseRelaxType** (HYPRE\_Solver solver, int alpha\_coarse\_relax\_type)

(Optional) Sets the coarsest level relaxation in the AMG solver for  $B_{\Pi}$ . The default is 8 (l1-GS). Use 9, 19, 29 or 99 for a direct solver.

6.6.21

int

HYPRE\_AMSSetBetaAMGOptions (HYPRE\_Solver solver, int beta\_coarsen\_type, int beta\_agg\_levels, int beta\_relax\_type, HYPRE\_Real beta\_strength\_threshold, int beta\_interp\_type, int beta\_Pmax)

(Optional) Sets AMG parameters for  $B_G$ . The defaults are 10, 1, 3, 0.25, 0, 0. See the user's manual for more details.

 $\_$  6.6.22  $\_$ 

int

 $\label{lem:hypre_ams} \textbf{HYPRE\_AMSSetBetaAMGCoarseRelaxType} \ ( \textbf{HYPRE\_Solver solver}, \ \textbf{int beta\_coarse\_relax\_type} )$ 

(Optional) Sets the coarsest level relaxation in the AMG solver for  $B_G$ . The default is 8 (l1-GS). Use 9, 19, 29 or 99 for a direct solver.

6.6.23

int
HYPRE\_AMSGetNumIterations (HYPRE\_Solver solver, int\* num\_iterations)

Returns the number of iterations taken

 $\_$  6.6.24  $\_$ 

int **HYPRE\_AMSGetFinalRelativeResidualNorm** (HYPRE\_Solver solver, HYPRE\_Real\* rel\_resid\_norm)

Returns the norm of the final relative residual

 $_{-}$  6.6.25  $_{--}$ 

HYPRE\_AMSProjectOutGradients (HYPRE\_Solver solver, HYPRE\_ParVector x)

For problems with zero-conductivity regions, project the vector onto the compatible subspace:  $x = (I - G_0(G_0^t G_0)^{-1} G_0^T)x$ , where  $G_0$  is the discrete gradient restricted to the interior nodes of the regions with zero conductivity. This ensures that x is orthogonal to the gradients in the range of  $G_0$ .

This function is typically called after the solution iteration is complete, in order to facilitate the visualization of the computed field. Without it the values in the zero-conductivity regions contain kernel components.

6.6.26

int
HYPRE\_AMSConstructDiscreteGradient (HYPRE\_ParCSRMatrix A,
HYPRE\_ParVector x\_coord, int\* edge\_vertex, int edge\_orientation,
HYPRE\_ParCSRMatrix\* G)

Construct and return the lowest-order discrete gradient matrix G using some edge and vertex information. We assume that edge\_vertex lists the edge vertices consecutively, and that the orientation of all edges is consistent.

If edge\_orientation = 1, the edges are already oriented.

If edge\_orientation = 2, the orientation of edge i depends only on the sign of edge\_vertex[2\*i+1] - edge\_vertex[2\*i].

Parallel auxiliary space divergence solver and preconditioner

\_\_ 6.7.1 \_\_

int HYPRE\_ADSCreate (HYPRE\_Solver\* solver)

Create an ADS solver object

\_ 6.7.2 \_

int HYPRE\_ADSDestroy (HYPRE\_Solver solver)

Destroy an ADS solver object

 $\_$  6.7.3  $\_$ 

int

**HYPRE\_ADSSetup** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Set up the ADS solver or preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:

solver [IN] object to be set up.

A [IN] ParCSR matrix used to construct the solver/preconditioner.

b Ignored by this function.

x Ignored by this function.

HYPRE\_ADSSolve (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Solve the system or apply ADS as a preconditioner. If used as a preconditioner, this function should be passed to the iterative solver SetPrecond function.

Parameters:

solver [IN] solver or preconditioner object to be applied.

A [IN] ParCSR matrix, matrix of the linear system to be solved

b [IN] right hand side of the linear system to be solved

x [OUT] approximated solution of the linear system to be solved

6.7.5

int **HYPRE\_ADSSetDiscreteCurl** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix C)

Sets the discrete curl matrix C. This function should be called before HYPRE\_ADSSetup()!

\_\_ 6.7.6 \_\_\_\_\_

HYPRE\_ADSSetDiscreteGradient (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix G)

Sets the discrete gradient matrix G. This function should be called before HYPRE\_ADSSetup()!

int **HYPRE\_ADSSetCoordinateVectors** (HYPRE\_Solver solver,
HYPRE\_ParVector x, HYPRE\_ParVector y, HYPRE\_ParVector z)

Sets the x, y and z coordinates of the vertices in the mesh. This function should be called before  $HYPRE\_ADSSetup()!$ 

 $_{-}$  6.7.8

int
HYPRE\_ADSSetInterpolations (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix RT\_Pi, HYPRE\_ParCSRMatrix RT\_Pix, HYPRE\_ParCSRMatrix RT\_Piy,
HYPRE\_ParCSRMatrix RT\_Piz, HYPRE\_ParCSRMatrix ND\_Pi,
HYPRE\_ParCSRMatrix ND\_Pix, HYPRE\_ParCSRMatrix ND\_Piy,
HYPRE\_ParCSRMatrix ND\_Piz)

(Optional) Set the (components of) the Raviart-Thomas ( $\Pi_{RT}$ ) and the Nedelec ( $\Pi_{ND}$ ) interpolation matrices.

This function is generally intended to be used only for high-order H(div) discretizations (in the lowest order case, these matrices are constructed internally in ADS from the discreet gradient and curl matrices and the coordinates of the vertices), though it can also be used in the lowest-order case or for other types of discretizations.

By definition, RT\_Pi and ND\_Pi are the matrix representations of the linear operators  $\Pi_{RT}$  and  $\Pi_{ND}$  that interpolate (high-order) vector nodal finite elements into the (high-order) Raviart-Thomas and Nedelec spaces. The component matrices are defined in both cases as  $\Pi^x \varphi = \Pi(\varphi, 0, 0)$  and similarly for  $\Pi^y$  and  $\Pi^z$ . Note that all these operators depend on the choice of the basis and degrees of freedom in the high-order spaces.

The column numbering of RT\_Pi and ND\_Pi should be node-based, i.e. the x/y/z components of the first node (vertex or high-order dof) should be listed first, followed by the x/y/z components of the second node and so on (see the documentation of HYPRE\_BoomerAMGSetDofFunc).

If used, this function should be called before hypre\_ADSSetup() and there is no need to provide the vertex coordinates. Furthermore, only one of the sets  $\{\Pi_{RT}\}$  and  $\{\Pi_{RT}^x, \Pi_{RT}^y, \Pi_{RT}^z\}$  needs to be specified (though it is OK to provide both). If RT\_Pix is NULL, then scalar  $\Pi$ -based ADS cycles, i.e. those with cycle\_type > 10, will be unavailable. Similarly, ADS cycles based on monolithic  $\Pi$  (cycle\_type < 10) require that RT\_Pi is not NULL. The same restrictions hold for the sets  $\{\Pi_{ND}\}$  and  $\{\Pi_{ND}^x, \Pi_{ND}^y, \Pi_{ND}^z\}$  – only one of them needs to be specified, and the availability of each enables different AMS cycle type options.

int HYPRE\_ADSSetMaxIter (HYPRE\_Solver solver, int maxit)

(Optional) Sets maximum number of iterations, if ADS is used as a solver. To use ADS as a preconditioner, set the maximum number of iterations to 1. The default is 20.

\_ 6.7.10 \_

int HYPRE\_ADSSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance, if ADS is used as a solver. When using ADS as a preconditioner, set the tolerance to 0.0. The default is  $10^{-6}$ .

6.7.11

int HYPRE\_ADSSetCycleType (HYPRE\_Solver solver, int cycle\_type)

(Optional) Choose which auxiliary-space solver to use. Possible values are:

- 1 3-level multiplicative solver (01210)
- 2 | 3-level additive solver (0+1+2)
- 3 | 3-level multiplicative solver (02120)
- 4 3-level additive solver (010+2)
- 5 | 3-level multiplicative solver (0102010)
- 6 3-level additive solver (1+020)
- 7 | 3-level multiplicative solver (0201020)
- 8 3-level additive solver (0(1+2)0)
- 11 | 5-level multiplicative solver (013454310)
- 12 | 5-level additive solver (0+1+3+4+5)
- 13 | 5-level multiplicative solver (034515430)
- 14 | 5-level additive solver (01(3+4+5)10)

The default is 1. See the user's manual for more details.

int HYPRE\_ADSSetPrintLevel (HYPRE\_Solver solver, int print\_level)

(Optional) Control how much information is printed during the solution iterations. The default is 1 (print residual norm at each step).

 $_{-}$  6.7.13  $_{-}$ 

int

**HYPRE\_ADSSetSmoothingOptions** (HYPRE\_Solver solver, int relax\_type, int relax\_times, HYPRE\_Real relax\_weight, HYPRE\_Real omega)

(Optional) Sets relaxation parameters for A. The defaults are 2, 1, 1.0, 1.0.

The available options for relax\_type are:

- 1  $\ell_1$ -scaled Jacobi
- 2  $\ell_1$ -scaled block symmetric Gauss-Seidel/SSOR
- 3 Kaczmarz
- 4 truncated version of  $\ell_1$ -scaled block symmetric Gauss-Seidel/SSOR
- 16 Chebyshev

\_ 6.7.14 \_

int

**HYPRE\_ADSSetChebySmoothingOptions** (HYPRE\_Solver solver, int cheby\_order, int cheby\_fraction)

(Optional) Sets parameters for Chebyshev relaxation. The defaults are 2, 0.3.

6.7.15

int

**HYPRE\_ADSSetAMSOptions** (HYPRE\_Solver solver, int cycle\_type, int coarsen\_type, int agg\_levels, int relax\_type, HYPRE\_Real strength\_threshold, int interp\_type, int Pmax)

(Optional) Sets AMS parameters for  $B_C$ . The defaults are 11, 10, 1, 3, 0.25, 0, 0. Note that cycle\_type should be greater than 10, unless the high-order interface of HYPRE\_ADSSetInterpolations is being used! See the user's manual for more details.

6.7.16

int **HYPRE\_ADSSetAMGOptions** (HYPRE\_Solver solver, int coarsen\_type, int agg\_levels, int relax\_type, HYPRE\_Real strength\_threshold, int interp\_type, int Pmax)

(Optional) Sets AMG parameters for  $B_{\Pi}$ . The defaults are 10, 1, 3, 0.25, 0, 0. See the user's manual for more details.

6.7.17

HYPRE\_ADSGetNumIterations (HYPRE\_Solver solver, int\* num\_iterations)

Returns the number of iterations taken

6.7.18

HYPRE\_ADSGetFinalRelativeResidualNorm (HYPRE\_Solver solver, HYPRE\_Real\* rel\_resid\_norm)

Returns the norm of the final relative residual

6.13.4

int

**HYPRE\_ParCSRHybridSolve** (HYPRE\_Solver solver, HYPRE\_ParCSRMatrix A, HYPRE\_ParVector b, HYPRE\_ParVector x)

Solve linear system

Parameters: solver [IN] solver or preconditioner object to be applied.

A [IN] ParCSR matrix, matrix of the linear system to be

 ${\rm solved}$ 

b [IN] right hand side of the linear system to be solved

x [OUT] approximated solution of the linear system to

be solved

int HYPRE\_ParCSRHybridSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

Set the convergence tolerance for the Krylov solver. The default is 1.e-7.

\_\_ 6.13.6 \_\_\_\_\_

HYPRE\_ParCSRHybridSetAbsoluteTol (HYPRE\_Solver solver, HYPRE\_Real tol)

Set the absolute convergence tolerance for the Krylov solver. The default is 0.

\_ 6.13.7 \_\_\_

int

 $\label{lem:hypre_parcsrhybridSetConvergenceTol} \begin{tabular}{l} HYPRE\_ParcsRHybridSetConvergenceTol \end{tabular} \begin{tabular}{l} (HYPRE\_Solver solver, HYPRE\_Real cf\_tol) \end{tabular}$ 

Set the desired convergence factor

6.13.8

HYPRE\_ParCSRHybridSetDSCGMaxIter (HYPRE\_Solver solver, int dscg\_max\_its)

Set the maximal number of iterations for the diagonally preconditioned solver

HYPRE\_ParCSRHybridSetPCGMaxIter (HYPRE\_Solver solver, int pcg\_max\_its)

Set the maximal number of iterations for the AMG preconditioned solver

\_\_\_ 6.13.10 \_\_\_\_\_

HYPRE\_ParCSRHybridSetSolverType (HYPRE\_Solver solver, int solver\_type)

Set the desired solver type. There are the following options: 2 GMRES

1 PCG (default)

3 BiCGSTAB

\_ 6.13.11 \_\_

int HYPRE\_ParCSRHybridSetKDim (HYPRE\_Solver solver, int k\_dim)

Set the Krylov dimension for restarted GMRES. The default is 5.

HYPRE\_ParCSRHybridSetTwoNorm (HYPRE\_Solver solver, int two\_norm)

Set the type of norm for PCG

int

HYPRE\_ParCSRHybridSetPrecond (HYPRE\_Solver solver, HYPRE\_PtrToParSolverFcn precond, HYPRE\_PtrToParSolverFcn precond\_setup, HYPRE\_Solver precond\_solver)

Set preconditioner if wanting to use one that is not set up by the hybrid solver

\_ 6.13.14 \_

int HYPRE\_ParCSRHybridSetLogging (HYPRE\_Solver solver, int logging)

Set logging parameter (default: 0, no logging)

\_ 6.13.15 \_\_\_\_

int

HYPRE\_ParCSRHybridSetPrintLevel (HYPRE\_Solver solver, int print\_level)

Set print level (default: 0, no printing)

6.13.16

HYPRE\_ParCSRHybridSetStrongThreshold (HYPRE\_Solver solver, HYPRE\_Real strong\_threshold)

(Optional) Sets AMG strength threshold. The default is 0.25. For 2d Laplace operators, 0.25 is a good value, for 3d Laplace operators, 0.5 or 0.6 is a better value. For elasticity problems, a large strength threshold, such as 0.9, is often better.

HYPRE\_ParCSRHybridSetMaxRowSum (HYPRE\_Solver solver, HYPRE\_Real max\_row\_sum)

(Optional) Sets a parameter to modify the definition of strength for diagonal dominant portions of the matrix. The default is 0.9. If max\_row\_sum is 1, no checking for diagonally dominant rows is performed.

6.13.18

HYPRE\_ParCSRHybridSetTruncFactor (HYPRE\_Solver solver, HYPRE\_Real trunc\_factor)

(Optional) Defines a truncation factor for the interpolation. The default is 0.

\_\_ 6.13.19 \_\_

int **HYPRE\_ParCSRHybridSetPMaxElmts** (HYPRE\_Solver solver, int P\_max\_elmts)

(Optional) Defines the maximal number of elements per row for the interpolation. The default is 0.

\_ 6.13.20 \_\_\_

HYPRE\_ParCSRHybridSetMaxLevels (HYPRE\_Solver solver, int max\_levels)

(Optional) Defines the maximal number of levels used for AMG. The default is 25.

int HYPRE\_ParCSRHybridSetMeasureType (HYPRE\_Solver solver, int measure\_type)

(Optional) Defines whether local or global measures are used

 $_{-}$  6.13.22  $_{-}$ 

HYPRE\_ParCSRHybridSetCoarsenType (HYPRE\_Solver solver, int coarsen\_type)

(Optional) Defines which parallel coarsening algorithm is used. There are the following options for coarsen\_type:

- 0 | CLJP-coarsening (a parallel coarsening algorithm using independent sets).
- 1 classical Ruge-Stueben coarsening on each processor, no boundary treatment
- 3 classical Ruge-Stueben coarsening on each processor, followed by a third pass, which adds coarse points on the boundaries
- Falgout coarsening (uses 1 first, followed by CLJP using the interior coarse points generated by 1 as its first independent set)
- 7 CLJP-coarsening (using a fixed random vector, for debugging purposes only)
- 8 PMIS-coarsening (a parallel coarsening algorithm using independent sets with lower complexities than CLJP, might also lead to slower convergence)
- 9 PMIS-coarsening (using a fixed random vector, for debugging purposes only)
- HMIS-coarsening (uses one pass Ruge-Stueben on each processor independently, followed by PMIS using the interior C-points as its first independent set)
- 11 one-pass Ruge-Stueben coarsening on each processor, no boundary treatment

The default is 6.

6.13.23

HYPRE\_ParCSRHybridSetCycleType (HYPRE\_Solver solver, int cycle\_type)

(Optional) Defines the type of cycle. For a V-cycle, set cycle\_type to 1, for a W-cycle set cycle\_type to 2. The default is 1.

int

HYPRE\_ParCSRHybridSetNumSweeps (HYPRE\_Solver solver, int num\_sweeps)

(Optional) Sets the number of sweeps. On the finest level, the up and the down cycle the number of sweeps are set to num\_sweeps and on the coarsest level to 1. The default is 1.

 $\_$  6.13.25  $\_$ 

int HYPRE\_ParCSRHybridSetCycleNumSweeps (HYPRE\_Solver solver, int num\_sweeps, int k)

(Optional) Sets the number of sweeps at a specified cycle. There are the following options for k:

the down cycle	if k=1
the up cycle	if $k=2$
the coarsest level	if $k=3$ .

HYPRE\_ParCSRHybridSetRelaxType (HYPRE\_Solver solver, int relax\_type)

(Optional) Defines the smoother to be used. It uses the given smoother on the fine grid, the up and the down cycle and sets the solver on the coarsest level to Gaussian elimination (9). The default is Gauss-Seidel (3).

There are the following options for relax\_type:

- 0 Jacobi Gauss-Seidel, sequential (very slow!) Gauss-Seidel, interior points in parallel, boundary sequential (slow!) hybrid Gauss-Seidel or SOR, forward solve 3 hybrid Gauss-Seidel or SOR, backward solve 4
- hybrid chaotic Gauss-Seidel (works only with OpenMP)
- hybrid symmetric Gauss-Seidel or SSOR
- Gaussian elimination (only on coarsest level)

int

 $\label{eq:hypre_parcsr} \textbf{HYPRE\_ParCSRHybridSetCycleRelaxType} \ ( \textbf{HYPRE\_Solver solver}, \ \textbf{int} \\ \textbf{relax\_type}, \ \textbf{int} \ \textbf{k} )$ 

(Optional) Defines the smoother at a given cycle. For options of relax\_type see description of HYPRE\_BoomerAMGSetRelaxType). Options for k are

the down cycle	if k=1
the up cycle	if $k=2$
the coarsest level	if k=3.

\_ 6.13.28 \_

int

HYPRE\_ParCSRHybridSetRelaxOrder (HYPRE\_Solver solver, int relax\_order)

(Optional) Defines in which order the points are relaxed. There are the following options for relax\_order:

- 0 the points are relaxed in natural or lexicographic order on each processor
- 1 CF-relaxation is used, i.e on the fine grid and the down cycle the coarse points are relaxed first, followed by the fine points; on the up cycle the F-points are relaxed first, followed by the C-points. On the coarsest level, if an iterative scheme is used, the points are relaxed in lexicographic order.

The default is 1 (CF-relaxation).

6.13.29

HYPRE\_ParCSRHybridSetRelaxWt (HYPRE\_Solver solver, HYPRE\_Real relax\_wt)

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on all levels.

	this assigns the given relaxation weight on all levels
$relax_weight = 0$	the weight is determined on each level with the estimate $\frac{3}{4\ D^{-1/2}AD^{-1/2}\ }$ ,
	where $D$ is the diagonal matrix of $A$ (this should only be used with Jacobi)
$relax_weight = -k$	the relaxation weight is determined with at most k CG steps on each level
	this should only be used for symmetric positive definite problems)

The default is 1.

6.13.30

int

HYPRE\_ParCSRHybridSetLevelRelaxWt (HYPRE\_Solver solver, HYPRE\_Real relax\_wt, int level)

(Optional) Defines the relaxation weight for smoothed Jacobi and hybrid SOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive relax\_weight, the parameter is determined on the given level as described for HYPRE\_BoomerAMGSetRelaxWt. The default is 1.

6.13.31

HYPRE\_ParCSRHybridSetOuterWt (HYPRE\_Solver solver, HYPRE\_Real outer\_wt)

(Optional) Defines the outer relaxation weight for hybrid SOR and SSOR on all levels.

omega > 0	this assigns the same outer relaxation weight omega on each level
omega = -k	an outer relaxation weight is determined with at most k CG steps on each level
	(this only makes sense for symmetric positive definite problems and smoothers, e.g. SSOR)

The default is 1.

6.13.32

HYPRE\_ParCSRHybridSetLevelOuterWt (HYPRE\_Solver solver, HYPRE\_Real outer\_wt, int level)

(Optional) Defines the outer relaxation weight for hybrid SOR or SSOR on the user defined level. Note that the finest level is denoted 0, the next coarser level 1, etc. For nonpositive omega, the parameter is determined on the given level as described for HYPRE\_BoomerAMGSetOuterWt. The default is 1.

int

 $\label{lem:hypre_parcsr} \mathbf{HYPRE\_ParcSRHybridSetMaxCoarseSize} \ ( \\ \mathbf{HYPRE\_Solver} \ solver, \ int \\ \mathbf{max\_coarse\_size} )$ 

(Optional) Defines the maximal coarse grid size. The default is 9.

6.13.34

int

 $\label{lem:hypre-parcsrhybridSetMinCoarseSize} \ (\mbox{HYPRE\_Solver solver, int min\_coarse\_size})$ 

(Optional) Defines the minimal coarse grid size. The default is 0.

\_\_ 6.13.35 \_\_\_

ınt

HYPRE\_ParCSRHybridSetSeqThreshold (HYPRE\_Solver solver, int seq\_threshold)

(Optional) enables redundant coarse grid size. If the system size becomes smaller than seq\_threshold, sequential AMG is used on all remaining processors. The default is 0.

6.13.36

ınt

HYPRE\_ParCSRHybridSetAggNumLevels (HYPRE\_Solver solver, int agg\_num\_levels)

(Optional) Defines the number of levels of aggressive coarsening, starting with the finest level. The default is 0, i.e. no aggressive coarsening.

HYPRE\_ParCSRHybridSetNumPaths (HYPRE\_Solver solver, int num\_paths)

(Optional) Defines the degree of aggressive coarsening. The default is 1, which leads to the most aggressive coarsening. Setting num\_paths to 2 will increase complexity somewhat, but can lead to better convergence.\*

\_ 6.13.38 \_

int **HYPRE\_ParCSRHybridSetNumFunctions** (HYPRE\_Solver solver, int num\_functions)

(Optional) Sets the size of the system of PDEs, if using the systems version. The default is 1.

 $_{-}$  6.13.39  $_{-}$ 

int HYPRE\_ParCSRHybridSetDofFunc (HYPRE\_Solver solver, int\* dof\_func)

(Optional) Sets the mapping that assigns the function to each variable, if using the systems version. If no assignment is made and the number of functions is k > 1, the mapping generated is (0,1,...,k-1,0,1,...,k-1,...).

6.13.40

int HYPRE\_ParCSRHybridSetNodal (HYPRE\_Solver solver, int nodal)

(Optional) Sets whether to use the nodal systems version. The default is 0 (the unknown based approach).

HYPRE\_ParCSRHybridGetNumIterations (HYPRE\_Solver solver, int\* num\_its)

Retrieves the total number of iterations

6.13.42

HYPRE\_ParCSRHybridGetDSCGNumIterations (HYPRE\_Solver solver, int\* dscg\_num\_its)

Retrieves the number of iterations used by the diagonally scaled solver

\_\_ 6.13.43 \_\_\_\_\_

HYPRE\_ParCSRHybridGetPCGNumIterations (HYPRE\_Solver solver, int\* pcg\_num\_its)

Retrieves the number of iterations used by the AMG preconditioned solver

\_\_ 6.13.44 \_\_\_\_\_

HYPRE\_ParCSRHybridGetFinalRelativeResidualNorm (HYPRE\_Solver solver, HYPRE\_Real\* norm)

Retrieves the final relative residual norm

6 14

# ParCSR LOBPCG Eigensolver

#### 

These routines should be used in conjunction with the generic interface in LOBPCG Eigensolver.

\_ 6.14.1 \_

int HYPRE\_ParCSRSetupInterpreter (mv\_InterfaceInterpreter\* i)

 $\label{loaded} Load interface interpreter. \ Vector \ part\ loaded\ with\ hypre\_ParKrylov\ functions\ and\ multivector\ part\ loaded\ with\ mv\_TempMultiVector\ functions.$ 

\_ 6.14.2 \_

int HYPRE\_ParCSRSetupMatvec (HYPRE\_MatvecFunctions\* mv)

 ${\bf Load\ Matvec\ interpreter\ with\ hypre\_ParKrylov\ functions}$ 

7

# Krylov Solvers

Names		
7.1	Krylov Solvers	
		21'
7.2	PCG Solver	
		218
7.3	GMRES Solver	
		220
7.4	FlexGMRES Solver	
		233
7.5	LGMRES Solver	
		239
7.6	BiCGSTAB Solver	
		248
7.7	CGNR Solver	
		250

These solvers support many of the matrix/vector storage schemes in hypre. They should be used in conjunction with the storage-specific interfaces, particularly the specific Create() and Destroy() functions.

7.1

#### 7.2.1

int **HYPRE\_PCGSetup** (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Prepare to solve the system. The coefficient data in  ${\tt b}$  and  ${\tt x}$  is ignored here, but information about the layout of the data may be used.

### \_ 7.2.2 \_

int **HYPRE\_PCGSolve** (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Solve the system

7.2.3

int HYPRE\_PCGSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the relative convergence tolerance

 $\_$  7.2.4  $\_$ 

int HYPRE\_PCGSetAbsoluteTol (HYPRE\_Solver solver, HYPRE\_Real a\_tol)

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The default convergence test is  $< C*r, r > \le \max(\text{relative\_tolerance}^2 * < C*b, b >$ , absolute\\_tolerance<sup>2</sup>).)

 $\_$  7.2.5  $\_$ 

int HYPRE\_PCGSetResidualTol (HYPRE\_Solver solver, HYPRE\_Real rtol)

(Optional) Set a residual-based convergence tolerance which checks if  $||r_{old} - r_{new}|| < rtol ||b||$ . This is useful when trying to converge to very low relative and/or absolute tolerances, in order to bail-out before roundoff errors affect the approximation.

\_ 7.2.6 \_

int HYPRE\_PCGSetMaxIter (HYPRE\_Solver solver, int max\_iter)

(Optional) Set maximum number of iterations

7.2.7

int HYPRE\_PCGSetTwoNorm (HYPRE\_Solver solver, int two\_norm)

(Optional) Use the two-norm in stopping criteria

\_\_\_ 7.2.8 \_\_\_\_\_

int HYPRE\_PCGSetRelChange (HYPRE\_Solver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

\_\_\_ 7.2.9 \_\_\_\_\_

HYPRE\_PCGSetRecomputeResidual (HYPRE\_Solver solver, int recompute\_residual)

(Optional) Recompute the residual at the end to double-check convergence

\_ 7.2.10 \_\_\_\_\_

int **HYPRE\_PCGSetRecomputeResidualP** (HYPRE\_Solver solver, int recompute\_residual\_p)

(Optional) Periodically recompute the residual while iterating

7 2 11

int

**HYPRE\_PCGSetPrecond** (HYPRE\_Solver solver, HYPRE\_PtrToSolverFcn precond, HYPRE\_PtrToSolverFcn precond\_setup, HYPRE\_Solver precond\_solver)

(Optional) Set the preconditioner to use

\_\_\_ 7.2.12 \_\_\_\_\_

int HYPRE\_PCGSetLogging (HYPRE\_Solver solver, int logging)

(Optional) Set the amount of logging to do

\_ 7.2.13 \_\_

7.3.23	int	

### HYPRE\_GMRESGetConverged (HYPRE\_Solver solver, int\* converged)..... 232

\_ 7.3.1 \_\_\_\_\_

int **HYPRE\_GMRESSetup** (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

7.3.2

HYPRE\_GMRESSolve (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Solve the system

7.3.3

int HYPRE\_GMRESSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the relative convergence tolerance

 $_{-}$  7.3.4  $_{-}$ 

HYPRE\_GMRESSetAbsoluteTol (HYPRE\_Solver solver, HYPRE\_Real a\_tol)

(Optional) Set the absolute convergence tolerance (default is 0). If one desires the convergence test to check the absolute convergence tolerance only, then set the relative convergence tolerance to 0.0. (The convergence test is  $||r|| \le \max(\text{relative\_tolerance*}||b||)$ , absolute\\_tolerance).)

7.3.5

int HYPRE\_GMRESSetMaxIter (HYPRE\_Solver solver, int max\_iter)

(Optional) Set maximum number of iterations

\_ 7.3.6 \_

int HYPRE\_GMRESSetKDim (HYPRE\_Solver solver, int k\_dim)

(Optional) Set the maximum size of the Krylov space

 $\_$  7.3.7  $\_$ 

int HYPRE\_GMRESSetRelChange (HYPRE\_Solver solver, int rel\_change)

(Optional) Additionally require that the relative difference in successive iterates be small

\_ 7.3.8 \_

ınt

**HYPRE\_GMRESSetSkipRealResidualCheck** (HYPRE\_Solver solver, int skip\_real\_r\_check)

(Optional) By default, hypre checks for convergence by evaluating the actual residual before returning from GMRES (with restart if the true residual does not indicate convergence). This option allows users to skip the evaluation and the check of the actual residual for badly conditioned problems where restart is not expected to be beneficial.

7.3.9

int

**HYPRE\_GMRESSetPrecond** (HYPRE\_Solver solver, HYPRE\_PtrToSolverFcn precond, HYPRE\_PtrToSolverFcn precond\_setup, HYPRE\_Solver precond\_solver)

(Optional) Set the preconditioner to use

7.3.10

int HYPRE\_GMRESSetLogging (HYPRE\_Solver solver, int logging)

(Optional) Set the amount of logging to do

\_ 7.3.11 \_\_

int HYPRE\_GMRESSetPrintLevel (HYPRE\_Solver solver, int level)

(Optional) Set the amount of printing to do to the screen

\_ 7.3.12 \_\_\_

HYPRE\_GMRESGetNumIterations (HYPRE\_Solver solver, int\* num\_iterations)

Return the number of iterations taken

7.3.13

HYPRE\_GMRESGetFinalRelativeResidualNorm (HYPRE\_Solver solver, HYPRE\_Real\* norm)

Return the norm of the final relative residual

\_\_\_\_ 7.3.14 \_\_\_\_\_

 $int \ \mathbf{HYPRE\_GMRESGetResidual} \ (HYPRE\_Solver \ solver, \ void** \ residual)$ 

Return the residual

7.3.15

int HYPRE\_GMRESGetTol (HYPRE\_Solver solver, HYPRE\_Real\* tol)

7.3.16

HYPRE\_GMRESGetAbsoluteTol (HYPRE\_Solver solver, HYPRE\_Real\* tol)

7.3.17

 $int \ \mathbf{HYPRE\_GMRESGetMaxIter} \ (HYPRE\_Solver \ solver, \ int^* \ max\_iter)$

	······································	253

\_\_ 7.7.1 \_\_\_\_\_

HYPRE\_CGNRSetup (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Prepare to solve the system. The coefficient data in b and x is ignored here, but information about the layout of the data may be used.

7.7.2

HYPRE\_CGNRSolve (HYPRE\_Solver solver, HYPRE\_Matrix A, HYPRE\_Vector b, HYPRE\_Vector x)

Solve the system

7.7.3

int HYPRE\_CGNRSetTol (HYPRE\_Solver solver, HYPRE\_Real tol)

(Optional) Set the convergence tolerance

\_ 7.7.4 \_

int HYPRE\_CGNRSetMaxIter (HYPRE\_Solver solver, int max\_iter)

(Optional) Set maximum number of iterations

7.7.5

int
HYPRE\_CGNRSetPrecond (HYPRE\_Solver solver, HYPRE\_PtrToSolverFcn
precond, HYPRE\_PtrToSolverFcn precondT, HYPRE\_PtrToSolverFcn
precond\_setup, HYPRE\_Solver precond\_solver)

(Optional) Set the preconditioner to use. Note that the only preconditioner available in hypre for use with CGNR is currently BoomerAMG. It requires to use Jacobi as a smoother without CF smoothing, i.e. relax\_type needs to be set to 0 or 7 and relax\_order needs to be set to 0 by the user, since these are not default values. It can be used with a relaxation weight for Jacobi, which can significantly improve convergence.

7.7.6

int HYPRE\_CGNRSetLogging (HYPRE\_Solver solver, int logging)

(Optional) Set the amount of logging to do

\_ 7.7.7 \_

HYPRE\_CGNRGetNumIterations (HYPRE\_Solver solver, int\* num\_iterations)

Return the number of iterations taken

\_ 7.7.8 \_

int

 $\label{lem:hypre_converse} \begin{aligned} \mathbf{HYPRE\_CGNRGetFinalRelativeResidualNorm} \ (\mathbf{HYPRE\_Solver} \ solver, \\ \mathbf{HYPRE\_Real*} \ norm) \end{aligned}$ 

Return the norm of the final relative residual

\_\_ 7.7.9 \_

int **HYPRE\_CGNRGetPrecond** (HYPRE\_Solver solver, HYPRE\_Solver\* precond\_data\_ptr)

8

## Eigensolvers

Names		
8.1	EigenSolvers	
		254
8.2	LOBPCG Eigensolver	
		255

These eigensolvers support many of the matrix/vector storage schemes in hypre. They should be used in conjunction with the storage-specific interfaces.

8.1

\_ 9.1 \_

### **FEI Functions**

$\mathbf{Names}$		
9.1.1	LLNL_FEI_Impl (MPI_Comm comm)  Finite element interface constructor: this function creates an instantiation of the HYPRE fei class.	262
9.1.2	~LLNL_FEI_Impl ()  Finite element interface destructor: this function destroys the object as well as its internal memory allocations.	262
9.1.3	int  parameters (int numParams, char** paramStrings)  The parameter function is the single most important function to pass solver information (which solver, which preconditioner, tolerance, other solver parameters) to HYPRE.	263
9.1.4	int intFields (int numFields, int* fieldSizes, int* fieldIDs)  Each node or element variable has one or more fields	263
9.1.5	int initElemBlock (int elemBlockID, int numElements, int numNodesPerElement, int* numFieldsPerNode, int** nodalFieldIDs, int numElemDOFFieldsPerElement, int* elemDOFFieldIDs, int interleaveStrategy)  The whole finite element mesh can be broken down into a number of element blocks.	263
9.1.6	int initElem (int elemBlockID, int elemID, int* elemConn)  This function initializes element connectivity (that is, the node identifiers associated with the current element) given an element block identifier and the element identifier with the element block.	264
9.1.7	int	

	initSharedNodes (int nShared, int* sharedIDs, int* sharedLengs, int** sharedProcs)	
	This function initializes the nodes that are shared between the current processor and its neighbors.	264
9.1.8	int	
J.1.0	initCRMult (int CRListLen, int* CRNodeList, int* CRFieldList, int* CRID)  This function initializes the Lagrange multiplier constraints	264
9.1.9	$\operatorname{int}$	
	initComplete ()  This function signals to the FEI that the initialization step has been completed	265
9.1.10	$\operatorname{int}$	
	resetSystem (double s)  This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to s	265
9.1.11	$\operatorname{int}$	
	resetMatrix (double s)  This function resets the global matrix to be of the same sparsity pattern as	
	before but with every entry set to s	265
9.1.12	$\operatorname{int}$	
	resetRHSVector (double s)  This function resets the right hand side vector to s	266
9.1.13	$\operatorname{int}$	
	resetInitialGuess (double s)  This function resets the solution vector to s	266
9.1.14	$\operatorname{int}$	
	loadNodeBCs (int nNodes, int* nodeIDs, int fieldID, double** alpha, double** beta, double** gamma)	
	This function loads the nodal boundary conditions	266
9.1.15	$\operatorname{int}$	
	sumInElem (int elemBlockID, int elemID, int* elemConn, double** elemStiff, double* elemLoad, int elemFormat)  This function adds the element contribution to the global stiffness matrix	
	and also the element load to the right hand side vector	267
9.1.16	$\operatorname{int}$	
	<b>sumInElemMatrix</b> (int elemBlock, int elemID, int* elemConn, double** elemStiffness, int elemFormat)	
	This function differs from the sumInElem function in that the right hand load vector is not passed.	267
9.1.17	int	
	sumInElemRHS (int elemBlock, int elemID, int* elemConn, double* elemLoad)	20-
	This function adds the element load to the right hand side vector	267
9.1.18	int	
	loadComplete ()  This function signals to the FEI that the loading phase has been completed.	
	This function signals to the FEI that the tolding phase has been completed.	268
9.1.19	$\operatorname{int}$	

	getNumBlockActNodes (int elemBlockID, int* nNodes)  This function returns the number of nodes given the element block	268
9.1.20	$\operatorname{int}$	
	getNumBlockActEqns (int elemBlockID, int* nEqns)	
	This function returns the number of unknowns given the element block	268
9.1.21	$\operatorname{int}$	
	getBlockNodeIDList (int elemBlockID, int numNodes, int* nodeIDList)	
	This function returns the node identifiers given the element block	269
9.1.22	$\operatorname{int}$	
	getBlockNodeSolution (int elemBlockID, int numNodes, int* nodeIDList,	
	int* solnOffsets, double* solnValues)	
	This function returns the nodal solutions given the element block number.	269
9.1.23	$\operatorname{int}$	
	loadCRMult (int CRID, int CRListLen, int* CRNodeList, int* CRFieldList,	
	double* CRWeightList, double CRValue)	
	This function loads the Lagrange multiplier constraints	269

## LLNL\_FEI\_Impl (MPI\_Comm comm)

Finite element interface constructor: this function creates an instantiation of the HYPRE fei class.

Parameters: comm - an MPI communicator

9.1.2

## $^{\sim}$ LLNL\_FEI\_Impl ()

Finite element interface destructor: this function destroys the object as well as its internal memory allocations.

Parameters: - no parameter needed

int parameters (int numParams, char\*\* paramStrings)

The parameter function is the single most important function to pass solver information (which solver, which preconditioner, tolerance, other solver parameters) to HYPRE.

Parameters: numParams - number of command strings

paramStrings - the command strings

9.1.4

int initFields (int numFields, int\* fieldSizes, int\* fieldIDs)

Each node or element variable has one or more fields. The field information can be set up using this function.

Parameters: numFields - total number of fields for all variable types

fieldSizes - degree of freedom for each field type

fieldIDs - a list of field identifiers

9.1.5

int

initElemBlock (int elemBlockID, int numElements, int numNodesPerElement, int\* numFieldsPerNode, int\*\* nodalFieldIDs, int numElemDOFFieldsPerElement, int\* elemDOFFieldIDs, int interleaveStrategy)

The whole finite element mesh can be broken down into a number of element blocks. The attributes for each element block are: an identifier, number of elements, number of nodes per elements, the number of fields in each element node, etc.

Parameters: elemblockID - element block identifier

numElements - number of element in this block

numNodesPerElement - number of nodes per element in this block

numFieldsPerNode - number of fields for each node

nodalFieldIDs - field identifiers for the nodal unknowns

numElemDOFFieldsPerElement - number of fields for the element

elemDOFFieldIDs - field identifier for the element unknowns interleaveStratety - indicates how unknowns are ordered

int initElem (int elemBlockID, int elemID, int\* elemConn)

This function initializes element connectivity (that is, the node identifiers associated with the current element) given an element block identifier and the element identifier with the element block.

Parameters: elemblockID - element block identifier

elemID - element identifier

elemConn - a list of node identifiers for this element

9.1.7

int initSharedNodes (int nShared, int\* sharedIDs, int\* sharedLengs, int\*\* sharedProcs)

This function initializes the nodes that are shared between the current processor and its neighbors. The FEI will decide a unique processor each shared node will be assigned to.

Parameters: nShared - number of shared nodes

sharedIDs - shared node identifiers

sharedLengs - the number of processors each node shares withsharedProcs - the processor identifiers each node shares with

9.1.8

int initCRMult (int CRListLen, int\* CRNodeList, int\* CRFieldList, int\* CRID)

This function initializes the Lagrange multiplier constraints

Parameters: CRListLen - the number of constraints

CRNodeList - node identifiers where constraints are applied
 CRFieldList - field identifiers within nodes where constraints are

applied

CRID - the constraint identifier

 $_{-}$  9.1.9  $_{-}$ 

int initComplete ()

This function signals to the FEI that the initialization step has been completed. The loading step will follow.

Parameters: - no parameter needed

\_ 9.1.10 \_\_

int resetSystem (double s)

This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to s. The right hand side is set to 0.

Parameters:

s - the value each matrix entry is set to.

9.1.11

int resetMatrix (double s)

This function resets the global matrix to be of the same sparsity pattern as before but with every entry set to s.

Parameters:

s - the value each matrix entry is set to.

int resetRHSVector (double s)

This function resets the right hand side vector to s.

Parameters:

s - the value each right hand side vector entry is set to.

9.1.13

int resetInitialGuess (double s)

This function resets the solution vector to s.

Parameters:

s - the value each solution vector entry is set to.

9.1.14

loadNodeBCs (int nNodes, int\* nodeIDs, int fieldID, double\*\* alpha, double\*\* beta, double\*\* gamma)

This function loads the nodal boundary conditions. The boundary conditions

Parameters: nNodes - number of nodes boundary conditions are imposed

nodeIDs - nodal identifiers

fieldID - field identifier with nodes where BC are imposed

alpha - the multipliers for the field

- the multipliers for the normal derivative of the field- the boundary values on the right hand side of the

 ${\it equations}$ 

int **sumInElem** (int elemBlockID, int elemID, int\* elemConn, double\*\* elemStiff, double\* elemLoad, int elemFormat)

This function adds the element contribution to the global stiffness matrix and also the element load to the right hand side vector

Parameters: elemBlockID - element block identifier

elemID - element identifier

elemConn - a list of node identifiers for this element

elemStiff - element stiffness matrix

elemLoad - right hand side (load) for this element- the format the unknowns are passed in

9.1.16

int sumInElemMatrix (int elemBlock, int elemID, int\* elemConn, double\*\* elemStiffness, int elemFormat)

This function differs from the sumInElem function in that the right hand load vector is not passed.

Parameters: elemBlockID - element block identifier

elemID - element identifier

elemConn - a list of node identifiers for this element

elemStiff - element stiffness matrix

elemFormat - the format the unknowns are passed in

9.1.17

sumInElemRHS (int elemBlock, int elemID, int\* elemConn, double\* elemLoad)

This function adds the element load to the right hand side vector

Parameters: elemBlockID - element block identifier

elemID - element identifier

elemConn - a list of node identifiers for this element - right hand side (load) for this element

9.1.18

int loadComplete ()

This function signals to the FEI that the loading phase has been completed.

Parameters: - no parameter needed

9.1.19

int getNumBlockActNodes (int elemBlockID, int\* nNodes)

This function returns the number of nodes given the element block.

Parameters: elemBlockID - element block identifier

nNodes - the number of nodes to be returned

\_ 9.1.20 \_

int **getNumBlockActEqns** (int elemBlockID, int\* nEqns)

This function returns the number of unknowns given the element block.

Parameters: elemBlockID - element block identifier

nEqns - the number of unknowns to be returned

#### 9.1.21 \_

int getBlockNodeIDList (int elemBlockID, int numNodes, int\* nodeIDList)

This function returns the node identifiers given the element block.

Parameters: elemBlockID - element block identifier

numNodes - the number of nodes
nodeIDList - the node identifiers

9.1.22 \_

int

getBlockNodeSolution (int elemBlockID, int numNodes, int\* nodeIDList, int\* solnOffsets, double\* solnValues)

This function returns the nodal solutions given the element block number.

Parameters: elemBlockID - element block identifier

numNodes - the number of nodesnodeIDList - the node identifiers

solnOffsets - the equation number for each nodal solution

solnValues - the nodal solution values

 $_{-}$  9.1.23  $_{-}$ 

int

loadCRMult (int CRID, int CRListLen, int\* CRNodeList, int\* CRFieldList, double\* CRWeightList, double CRValue)

This function loads the Lagrange multiplier constraints

Parameters: CRID - the constraint identifier

CRListLen - the number of constraints

CRNodeList - node identifiers where constraints are applied
 CRFieldList - field identifiers within nodes where constraints are

applied

CRWeightList - a list of weights applied to each specified field

CRValue - the constraint value (right hand side of the con-

straint)

9.2

### **FEI Solver Parameters**

$\mathbf{Names}$		
9.2.1	Preconditioners and Solvers  Here the various options for solvers and preconditioners are defined	270
9.2.2	BoomerAMG  Parameter options for the algebraic multigrid preconditioner BoomerAMG.	271
9.2.3	MLI  Parameter options for the smoothed aggregation preconditioner MLI	272
9.2.4	Various  Parameter options for ILUT, ParaSails and polynomial preconditioners are defined	273
9.2.5	Matrix <b>Reduction</b> Parameters which define different reduction modes	274
9.2.6	Performance Tuning and <b>Diagnostics</b> Parameters control diagnostic information, memory use, etc	274
9.2.7	Miscellaneous  Parameters that are helpful for finite element information.	275

9.2.1

### Preconditioners and Solvers

Here the various options for solvers and preconditioners are defined.

solver xxx where xxx specifies one of cg, gmres, fgmres, bicgs, bicgstab, tfqmr, symqmr, superlu, or superlux. The default is gmres. The solver type can be followed by override to specify its priority when multiple solvers are declared at random order.

**preconditioner xxx** where xxx is one of diagonal, pilut, euclid, parasails, boomeramg, poly, or mli. The default is diagonal. Another option for xxx is reuse which allows the preconditioner to be reused (this should only be set after a preconditioner has been set up already). The preconditioner type can be followed by override to specify its priority when multiple preconditioners are declared at random order.

- maxIterations xxx where xxx is an integer specifying the maximum number of iterations permitted for the iterative solvers. The default value is 1000.
- **tolerance xxx** where xxx is a floating point number specifying the termination criterion for the iterative solvers. The default value is 1.0E-6.
- gmresDim xxx where xxx is an integer specifying the value of m in restarted GMRES(m). The default value is 100.
- **stopCrit xxx** where xxx is one of absolute or relative stopping criterion.
- **superluOrdering xxx** where xxx specifies one of natural or mmd (minimum degree ordering). This ordering is used to minimize the number of nonzeros generated in the LU decomposition. The default is natural ordering.
- **superluScale xxx** where xxx specifies one of y (perform row and column scalings before decomposition) or n. The default is no scaling.

#### 9.2.2

### BoomerAMG

Parameter options for the algebraic multigrid preconditioner BoomerAMG.

- **amgMaxLevels xxx** where xxx is an integer specifying the maximum number of levels to be used for the grid hierarchy.
- amgCoarsenType xxx where xxx specifies one of falgout or ruge, or default (CLJP) coarsening for Boomer-AMG.
- **amgMeasureType xxx** where xxx specifies one of local or or **global**. This parameter affects how coarsening is performed in parallel.
- amgRelaxType xxx where xxx is one of jacobi (Damped Jacobi), gs-slow (sequential Gauss-Seidel), gs-fast (Gauss-Seidel on interior nodes), or hybrid. The default is hybrid.
- **amgNumSweeps xxx** where xxx is an integer specifying the number of pre- and post-smoothing at each level of BoomerAMG. The default is two pre- and two post-smoothings.
- amgRelaxWeight xxx where xxx is a floating point number between 0 and 1 specifying the damping factor for BoomerAMG's damped Jacobi and GS smoothers. The default value is 1.0.
- amgRelaxOmega xxx where xxx is a floating point number between 0 and 1 specifying the damping factor for BoomerAMG's hybrid smoother for multiple processors. The default value is 1.0.
- amgStrongThreshold xxx where xxx is a floating point number between 0 and 1 specifying the threshold used to determine strong coupling in BoomerAMG's coasening. The default value is 0.25.
- amgSystemSize xxx where xxx is the degree of freedom per node.

amgMaxLevels xxx where xxx is an integer specifying the maximum number of iterations to be used during the solve phase.

amgUseGSMG - tells BoomerAMG to use a different coarsening called GSMG.

amgGSMGNumSamples where xxx is the number of samples to generate to determine how to coarsen for GSMG.

9.2.3 \_\_\_\_\_\_ MLI

Parameter options for the smoothed aggregation preconditioner MLI.

outputLevel xxx where xxx is the output level for diagnostics.

method xxx where xxx is either AMGSA (default), AMGSAe, to indicate which MLI algorithm is to be used.

numLevels xxx where xxx is the maximum number of levels (default=30) used.

maxIterations xxx where xxx is the maximum number of iterations (default = 1 as preconditioner).

**cycleType xxx** where xxx is either 'V' or 'W' cycle (default = 'V').

**strengthThreshold xxx** strength threshold for coarsening (default = 0).

smoother xxx where xxx is either Jacobi, BJacobi, GS, SGS, HSGS (SSOR,default), BSGS, ParaSails, MLS, CGJacobi, CGBJacobi, or Chebyshev.

**numSweeps xxx** where xxx is the number of smoother sweeps (default = 2).

coarseSolver xxx where xxx is one of those in 'smoother' or SuperLU (default).

minCoarseSize xxx where xxx is the minimum coarse grid size to control the number of levels used (default = 3000).

**Pweight xxx** where xxx is the relaxation parameter for the prolongation smoother (default 0.0).

**nodeDOF** xxx where xxx is the degree of freedom for each node (default = 1).

**nullSpaceDim xxx** where xxx is the dimension of the null space for the coarse grid (default = 1).

**useNodalCoord xxx** where xxx is either 'on' or 'off' (default) to indicate whether the nodal coordinates are used to generate the initial null space.

**saAMGCalibrationSize**  $\mathbf{x}\mathbf{x}\mathbf{x}$  where  $\mathbf{x}\mathbf{x}\mathbf{x}$  is the additional null space vectors to be generated via calibration (default = 0).

 $numSmoothVecs\ xxx$  where xxx is the number of near null space vectors used to create the prolongation operator (default = 0).

**smoothVecSteps xxx** where xxx is the number of smoothing steps used to generate the smooth vectors (default = 0).

In addition, to use 'AMGSAe', the parameter 'haveSFEI' has to be sent into the FEI using the parameters function (this option is valid only for the Sandia FEI implementation).

Various

Parameter options for ILUT, ParaSails and polynomial preconditioners are defined.

**euclidNlevels xxx** where xxx is an non-negative integer specifying the desired sparsity of the incomplete factors. The default value is 0.

**euclidThreshold xxx** where xxx is a floating point number specifying the threshold used to sparsify the incomplete factors. The default value is 0.0.

parasailsThreshold xxx where xxx is a floating point number between 0 and 1 specifying the threshold used to prune small entries in setting up the sparse approximate inverse. The default value is 0.0.

parasailsNlevels xxx where xxx is an integer larger than 0 specifying the desired sparsity of the approximate inverse. The default value is 1.

**parasailsFilter xxx** where xxx is a floating point number between 0 and 1 specifying the threshold used to prune small entries in A. The default value is 0.0.

parasailsLoadbal xxx where xxx is a floating point number between 0 and 1 specifying how load balancing has to be done (Edmond, explain please). The default value is 0.0.

parasailsSymmetric sets Parasails to take A as symmetric.

parasailsUnSymmetric sets Parasails to take A as nonsymmetric (default).

parasailsReuse sets Parasails to reuse the sparsity pattern of A.

polyorder xxx where xxx is the order of the least-squares polynomial preconditioner.

9.2.5

### Matrix Reduction

Parameters which define different reduction modes.

schurReduction turns on the Schur reduction mode.

slideReduction turns on the slide reduction mode.

slideReduction2 turns on the slide reduction mode version 2 (see section 2).

**slideReduction3** turns on the slide reduction mode version 3 (see section 2).

9.2.6

### Performance Tuning and **Diagnostics**

Parameters control diagnostic information, memory use, etc.

outputLevel xxx where xxx is an integer specifying the output level. An output level of 1 prints only the solver information such as number of iterations and timings. An output level of 2 prints debug information such as the functions visited and preconditioner information. An output level of 3 or higher prints more debug information such as the matrix and right hand side loaded via the LinearSystemCore functions to the standard output.

setDebug xxx where xxx is one of slideReduction1, slideReduction2, slideReduction3 (level 1,2,3 diagnostics in the slide surface reduction code), printMat (print the original matrix into a file), printReducedMat (print the reduced matrix into a file), printSol (print the solution into a file), ddilut (output diagnostic information for DDIlut preconditioner setup), and amgDebug (output diagnostic information for AMG).

**optimizeMemory** cleans up the matrix sparsity pattern after the matrix has been loaded. (It has been kept to allow matrix reuse.)

**imposeNoBC** turns off the boundary condition to allow diagnosing the matrix (for example, checking the null space.)

# Miscellaneous

Parameters that are helpful for finite element information.

- **AConjugateProjection xxx** where xxx specifies the number of previous solution vectors to keep for the A-conjugate projection. The default is 0 (the projection is off).
- minResProjection xxx where xxx specifies the number of previous solution vectors to keep for projection. The default is 0 (the projection is off).
- haveFEData indicates that additional finite element information are available to assist in building more efficient solvers.
- have SFEI indicates that the simplified finite element information are available to assist in building more efficient solvers.
